>George

I'll second George's comments about the Radio Shack discone. It's one of the best antennas for receiving military and VHF aircraft traffic I've ever used. My discone is mounted on a 10 foot mast placed on the roof of my house, and my PRO-2006 and PR0-2056 scanners will easily hear airport control towers 35 miles north and south of my location. The Radio Shack discone does a good job of receiving VHF low band and 800-900 MHz signals as well.

73,
David

Definately the Panasonic.I paid $150 but forgot the model number 1870
maybe? It has caller id,900 dss,speakerphone,lighted keypad,answering
machine,more.......Take a look.

Bud, you're just flat wrong. There's no other way to say it. OWNING the
equipment is NOT a crime.

USING that equipment would be a crime if you were not licenced to do so.

Please stop your ongoing troll.

It's very sad to see that people actually are willing to just "roll over and
play dead" when they have had their civil rights violated.

I'm not slamming you directly, per se, but I do find it very disturbing.

Ahhhh. Now your story is starting to piece together.

It's quite obvious from just what you wrote that the repossession was because Uncle Sam mistakenly sold the radios in the first place (or were illegally sold as I suspect).

They were reclaiming their property. The fact that it was a radio is irrelevant. If "your friend" had "bought" a firearm from them or a stack of file folders - I'm sure the same actions would have been taken.

I suspect that none of this will make sense to you.

"Bud" <mircuser1234@yahoo.com> wrote:

I frequently travel I-81 in PA/MD/WV/VA.
Can anyone point me to a list of scanning frequencies useful on such
travels?
I have a good list of ham repeaters, what I need are Public Service
channels, Police, Highway, etc. along that route.
Recommendations of print/online sources would be much appreciated.

Gee, my transceiver transmits from 1.8 to 200 mhz an I have other
transceivers that operate on frequencies from 30 to 50 mhz, 143 to
175 mhz, 400 to 512 mhz and 800 to 950 mhz.

Call the police and tell them. I think you would get laugh at.

Hi Just so you know, if you want a award for code proficiency, The ARRL has offered one for many years. It's called the "code proficiency award. It's starts with the basic award at 10wpm with stickers for speed up to 40wpm. See www.arrl.org for more information.

MDWADE check again, part 97 pertains to amateur radio 'only'. Don't
try an pull this shit on our 800 radio system. You will loose your
radio and spend some time in jail.

Just because you are a 'ham' does not allow you to operate anywhere
you feel like.

A limited number of callsigns like yours will be available to 5wpm
extras under the vanity callsign program. That may not bother you,
but it bothers a lot of the radical PCTA folk.

1436. Using BNC antennas on SMA radios...what type of adapter do I need?

Newsgroup: rec.radio.scanner
Date: 2000-01-12 00:00:00 UTC
From: fjsieder@microimm.mcgill.xae
Message-ID: <387ca94a.943692678@news.mcgill.ca>
Source record: 96578
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi,

The title basically says it all...I'm new to scanners and may buy an Icom R2. I might want to use some BNC antennas on it and I'm getting confused as to what type of adapter I would need. In the review of it on Strongsignals.net Rich Wells mentions having to buy a BNC male to SMA female adapter to do this. However when looking at the Grove web site they include a BNC female to SMA male adapter as an optional accessory for this radio.

Which one is correct? What format adapter do I need if I want to use BNC antennas on this radio?

Thanks,
Felix

Hi,

I would like to buy a BNC antenna for a handheld which would give me good performance in the 800MHz range. Rich Wells (strongsignals.net) mentions both the Watson 800 BNC as well as the Max antenna from Grove. Can anybody comment on which of these is better and if there is anything that you would recommend over either of these? If you are recommending something else if possible could you mention a source to purchase what you recommend?

thanks,
Felix

Not that simple. Once you renew your license after the Epoch,
no one will be able to tell the difference from looking. I suppose
someone could come up with a clever callsign suffix to advertise
their legacy Extra status, like K6JQ/OF perhaps?

As for the grumbling about "Novxtra" and such - c'mon guys, show some
maturity. I expect this kind of "that's not fair!" bickering between
my youngest two children (ages 5 and 8), not from adults.

|>
|> I'm not slamming you directly, per se, but I do find it very disturbing.

I didn't say I'd roll over, but most people will.

The other problem is that even if you win in court, you lose. You're
out lots of time and money, your radio may be damaged in the process,
and the guys with guns will go out and do the same thing again to
someone else. They will even do things deliberately that they know
won't stand up in court, because the process is sufficient punishment

that they don't need to win in court.

This is the sad state of "justice" in the U.S.A. today.

>SMA female adapter to do this. However when looking at the Grove web
>site they include a BNC female to SMA male adapter as an optional
>accessory for this radio. Which one is correct? What format......""
Both are actually correct in a way, The Grove description is what is
ACTUALLY on each end of the adaptor, a BNC female (to "accept" the male BNC
antenna) and an SMA male. The StrongSignals description is "what the adapor
is doing", which is taking a BNC "male" antenna "into" an SMA Female jack on
the radio. If ordering the item thru the mail make sure you are clear as to
what has to be on each end of the adaptor you want to buy, as grove did for
their customers........

So Dick, are you going to carry around an internet-ready
laptop to prove that you are a pre-4/15/00 ham? How about
when your license comes up for renewal? The date on QRZ.com
will be after 4/15/00. OTOH, all I have to do is say I'm
an advanced and everyone knows I did 13wpm. :-) :-) :-)

Although there will be no more Advanced class licenses issued after
April 15, those who hold Advanced class licenses will continue to do so
indefinitely if I understand the R&O correctly. I would assume that if
you do a callsign search it will continue to show an Advanced class as
just that, which would tell you that they passed the 13 WPM.

Try this one. I'm not sure where you can buy this
adaptor, but here's the part number.

AMPHENOL 901-167-2 BNC Female to SMA Female.

As long as I can still eat in the same restaraunts, drink from the same fountains, participate in the voting process, and pee in the same (gender appropriate) restrooms, ya can do anything you want on the HF bands. Might I suggest, though, that the HF bands are not only "ours" (meaning the United States'). There will be many, many people in foreign lands listening to your tyrades, with a very highly raised eyebrow.

Bill, nice post. This is a healthy debate and while we all may
disagree, I think it's been an educational discussion to capture
all the elements, opinions,and viewpoints.

You hit the nail on the head regarding "Bash"ing into the
hobby. I remember those yellow and black "cliffs notes" looking books
with the cloaked vampire on the front advertised in the "Ham Radio"
magazine in the late 1970's. Now this has become mainstream practice
that our national organization, the ARRL, condones and promotes.

I am skeptical that the VEC will change the question pool -- they are
a not-for-profit organization on a tight budget and tighter timeline to
get a pool put together for the new exams by 4/15/2000.
I do not think there will be material changes to the existing question
pool, nor do I think we will migrate away from the publication of the
pool answers.

The one thing about elements 1A, 1B, and 1C is that it is difficult
to "cheat" (using the word loosely, since "Bash"ing is not technically
cheating, though memorizing the answers does defeat the purpose of the
exam to a large extent). The question pool for the CW element is not
published --- is that why folks complain that it is so difficult to
pass? There
are no "short cuts" to learning the code, except perhaps writing the
individual dots and dashes on the paper and then translating them after
the exam finishes (and most VE's will disallow that practice,
fortunately)

After reading all the debate, and stirring the pot to some degree
myself,
I am left with self-resolution on this conflict --It is not WHAT is
being tested, so much as "how" it is being tested. I'd be cool with a
difficult technical and operating skills exam replacing the CW element.
With no questions published in advance, where people have to learn not
only electronics theory and rules and regs, but also GOOD OPERATING
skill. The thing that makes the hobby so great is that folks value
their HF-priveleged
licenses because they take REAL WORK to accomplish learning morse. I
do
not see the same "respect for the service" with the no-code tech exam
that
I see for the Novice, General, Advanced, and Extra. The no code tech
is
more like a drivers license exam -- read a book for a couple hours,

memorize the answers, take a test, and you are licenced. Very
different
from taking 8 to 12 weeks to master the morse code at 5WPM and many more
hours to increase speed to 20+ WPM. Lots more investment.

Now, with the ability to memorize answers, and the ease of mastering 5
WPM
cw, the self-satisfaction, feeling of accomplishment, and time invested
in
learning within the hobby is diminished to a large degree. The
result, I contend, is less respect of the accomplishment, less respect
for the amateur radio service, less respect for the license.

Death of ham radio? No. Change? yes. For the better or worse?
time will tell.

Sounds like some people are doing some useless babble!
The restructuring doesnt make it easier for people to become hams!!!
You still have to pass your no-code exam and then pass 5wpm to
upgrade!! Whats the big deal??? Clinton administration didnt do
anything for me except give me a JOB and the ability to further my
education!! When has a republican did that for you? I can agree that
ALL POLITICIANS SUCK!!!!, but think before you speak!!

I hear all stating that tax cuts for the rich cause more circulation
of us funds... Yes it does, Right into another rich persons hands...
Therefore nothing is gained!!! 0=0

Who do you think forced SDMV to cut there reg fee's? Wasn't a
republican!!!

Start Giving to the people that make the world and not to those who
rule the world!!

Let nature take its course! If CW falls off the earth, then the only one to blame is yourself (not you in peticular)!! Religious CW operators that keep complaining about the new fcc restructuring and whining they may lose there band segments can only blame themselves due to the fact that they always put down the No-Coder instead of helping to teach the interested No-Coder! I am a No-Coder at present and when I hear hams complaining as such, I think why even try if this is how it is going to be on CW? I am going to get passed the code requirement and work on it to improve my speed, but I will never put down a No-Code Tech or anyone else that is interested in the same hobby as myself!! I encourage anyone to become a ham regardless if they were or still on the CB radio due to the fact that a CB Operator has more knowledge of basic radio operations than someone who hasnt operated a transceiver at all!!! I even hear others on usenet and on the ham bands worrying that HAM Radio will come another CB band, This is a bunch of bull too... When I lived in the San Jose, CA., There was 3 or more repeaters and several Frequencies in the HF Bands that sounded worse than CB Radio and 95% of the operators on these frequencies were Generals and above! So dont go flaming the No-Coders when your current problem with the General, Advanced and Extra class needs work!!!

As long as you aren't concerned about security. The handset communicates to the base using conventional 900Mzh freqs IN THE CLEAR.

Very misleading as they advertise it as Spread Spectrum. The base transmits in 2.4Ghz DSS, but that is a joke if the handset going back is wide open.

Sure, that's correct. I believe the topic was how to tell the
difference between a legacy Extra (with 20WPM credit) and new
Extras (with 5WPM credit).

Consumer Reports on the Panasonic KX-TG200 "gigarange" phone, from March
1999:

"We also couldn't substantiate the KX-TG200's claims for better security.
We were able to eavesdrop on the phone using a scanner."

To date, Panasonic has not disputed this report. I would not own one of
these phones if I was concerned about security....

Drew.

My only advice is to be very wary of the software if you decide to purchase any control type software for it.... See This information for more:

I have purchased Winscan Version 1.10, for the BC895XLT and BC245XLT. This software and the company does not seem to perform as it is advertised. For 2 weeks I have been fighting with the software to get it to save sound files. I have tried it on 2 different computers with the same results. I purchased the 2nd computer in an effort to not only upgrade my existing system, but to allow Winscan to work as advertised. The longest I have had it run without erroring out and turning off the save sound files to disk option is 10 minutes. I consistently get the following message, sometimes in a matter of seconds, sometimes in a matter of minutes, "mmsystem286 cannot save the specified file. Make sure you have enough disk space or are still connected to the network."

I am not on a network, I have 16 gigs of hd space. I have 192 Megs of Ram, A Pentium III 600 Mhz, SoundBlaster PCI 128 Soundcard, etc. A very nice system. At 10:00 EST, I called Pozilla Software / Winscan. Their Internet site advertises a call back within one hour if nobody answers and you have to leave a message. I left a message. At 3:00 p.m. (5 hours later) I called and spoke to someone and was told that no programmers were in right now, that they would call me back. As I write this synopsis of events, it is almost 5:00 and still no call-back from anyone who can help. I work with computers for a living, and have been involved with computers since 1982. I have formatted the harddrive, reinstalled Windows 98SE, reinstalled the sound software and drivers, etc. I am still no closer to resolving this problem.

In addition to this problem, I have several other issues with this software package. There is no ability from within the program to sort the frequencies, and so every time you enter a new frequency, you have to check your other 299 frequencies to be sure there is no duplication. This is difficult to do when there is no numerical order to them. When you edit a frequency, you do not get a cursor, and have to backspace everything until you get to the part of an entry you want

to edit. There is no option from within the program to print your frequency list, to make it easier to check, or just for storage/reference later. Although it is supposed to allow you to save sound files (.wav format), it automatically tags them with a filename corresponding to your earlier alpha tag description of that particular frequency. I would like an option to make the filename either /or the frequency number, or alpha tag description.

I am still waiting to hear from Pozilla in an effort to resolve the immediate problem of not being able to save sound files. I can only hope that possible future versions of their softare will resolve some of the many other smaller issues.

Anyone who is using software that will work with the BC895XLT, please email me and let me know what you are using, and how you like it. If you have any specific questions regarding the Winscan package, please feel free to ask, I will either check it out for you, or be more than happy to give you my opinions. Just my .02 (or maybe .09?) cents worth..... Sincerely, Xlat

Go to Rich Wells' site, www.strongsignals.net and look under PRESS
RELEASES...

You will see an article their for an SMA to BNC adapter which seems to
be just what the doctor ordered for all these new, small radios using
SMA mounts...

It is made by Stephen G. Gulyas, and he can be reached at
gulyas@netzero.net

I am gonna order a few myself...

Hmm! Even though memorizing the answer and CW is mostly what this post pertains to is not the problem!! If you memorize the answer then you get the question right, You have learned something regardless of what others say! In other words you might say that "0 being the answer to Question #44" is a memorized answer! However since the exams are not in a peticular order, there is no way to memorize an answer to a question unless you studied the book and sample questions! Which in turn means if someone passed the test then they so deserve to posses a license!

If you wish to protect CW, Quit bashing the No-Coders and teach a few!! That is the way to protect the CW portions of the band and to preserve the tradition! Explain to them why CW is important to you and why you enjoy CW so much! Dont point out its relevance or why its the best thing in communications, cuz everyone knows CW is not the best or fastest type of communication anymore!!! Encourage young and old users alike to pursue CW, but dont push it on those who have no interest!

I have interest in CW and upgrading to a higher class of license but I will not be the first to post a UseNet message Bitching and complaining about the possible loss of CW! If CW was lost, I would still be enthused by the means of communication to continue pursuing it and using it! It is not illegal to operate CW in non alotted CW portions of the bands.

Believe me, There are plenty of CB operators that would like to operate on those frequencies and if you dont encourage CW or stop bitching about CW, you will find more bootleggers on the band and blame the No-Coders for your own mistakes!

No-Coders are hams too, and by bashing a No-Coder you are Isolating yourselves to the point of extinction and will find yourself all alone!

I would love to hear a CB'er who really knew how to use the 10-codes.
The code 10-20 means "What's your location?" Can't tell how many
times I've heard "What's your twenty?" It's like saying "What's your
what's your location?"

Totally irrelevant.....a ham radio license is of no commercial use.
This is *Amateur* radio, not commercial/professional/broadcast/PCS
whatever.

The license is NOT a graduation certificate, but rather an entrance
permit to the hobby/service. What one chooses to learn after that is up
to them.

He does have the best site I've seen, no doubt about it. I'm afraid he dropped the ball on his review of Winscan however..... See my story:

I have purchased Winscan Version 1.10, for the BC895XLT and BC245XLT. This software and the company does not seem to perform as it is advertised. For 2 weeks I have been fighting with the software to get it to save sound files. I have tried it on 2 different computers with the same results. I purchased the 2nd computer in an effort to not only upgrade my existing system, but to allow Winscan to work as advertised. The longest I have had it run without erroring out and turning off the save sound files to disk option is 10 minutes. I consistently get the following message, sometimes in a matter of seconds, sometimes in a matter of minutes, "mmsystem286 cannot save the specified file. Make sure you have enough disk space or are still connected to the network."

I am not on a network, I have 16 gigs of hd space. I have 192 Megs of Ram, A Pentium III 600 Mhz, SoundBlaster PCI 128 Soundcard, etc. A very nice system. At 10:00 EST, I called Pozilla Software / Winscan. Their Internet site advertises a call back within one hour if nobody answers and you have to leave a message. I left a message. At 3:00 p.m. (5 hours later) I called and spoke to someone and was told that no programmers were in right now, that they would call me back. As I write this synopsis of events, it is almost 5:00 and still no call-back from anyone who can help. I work with computers for a living, and have been involved with computers since 1982. I have formatted the harddrive, reinstalled Windows 98SE, reinstalled the sound software and drivers, etc. I am still no closer to resolving this problem.

In addition to this problem, I have several other issues with this software package. There is no ability from within the program to sort the frequencies, and so every time you enter a new frequency, you have to check your other 299 frequencies to be sure there is no duplication. This is difficult to do when there is no numerical order

to them. When you edit a frequency, you do not get a cursor, and have to backspace everything until you get to the part of an entry you want to edit. There is no option from within the program to print your frequency list, to make it easier to check, or just for storage/reference later. Although it is supposed to allow you to save sound files (.wav format), it automatically tags them with a filename corresponding to your earlier alpha tag description of that particular frequency. I would like an option to make the filename either /or the frequency number, or alpha tag description.

I am still waiting to hear from Pozilla in an effort to resolve the immediate problem of not being able to save sound files. I can only hope that possible future versions of their softare will resolve some of the many other smaller issues.

Anyone who is using software that will work with the BC895XLT, please email me and let me know what you are using, and how you like it. If you have any specific questions regarding the Winscan package, please feel free to ask, I will either check it out for you, or be more than happy to give you my opinions. Just my .02 (or maybe .09?) cents worth..... Sincerely, Xlat

Safrak,

I would say about $50 if it is in good condition. It does have the 116-136 MHz band in addition to all the usual bands for an old scanner. It is also easy to put a discriminator tap on it. Audio is good. Does not need a wall wart - its built into the unit. it is a little bulky but it makes a good second scanner (if you don't need 800 MHz) or to keep in the car.

> Which would you buy?
>

I bought the 2052 a couple of weeks ago, very disappointed. Took it back and got my money back.

I also have a Bearcat 895xlt. A much better scanner than the 2052, much more sensitive on the 800mhz band, better audio, CTCSS (which the 2052 doesnt have), and I could go on and on.

A no-brainer - Go with the Bearcat 895xlt.

I have the Max 800, it is better than anything I have tried for 800mhz. In fact it is excellent for 800mhz use, but worthless for other bands.
I dont have a Watson 800, but if I knew where to buy one, I probably would get one to try out.

Ever ordered Shrimp Scampi or said "Shrimp Scampi"?
Then you've said shrimp shrimp. "scampi" is "shrimp"
in Italian.

And like the "new breed" of hams on our local repeaters and 10M SSB
who say "seventy-threes" which means "best regardses" or "seventy
thirds" which means 23 1/3 (last time I poked it into the calculator,
anyway)

things that make you go hmmmm.......

Bravo, Cecil. You speak the truth. As an extra class 20 WPM ham who
enjoys CW, I decided to do my share elmering / being a VE. So,
I teach a cw practice session via repeater twice a week for 30 minutes
per session. It's amazing how many no-coders expressed interest in
"finally learning the code" but when they found out you cant "cheat"
and have to really learn CW (not just memorize published
test pool answers) they gave up and bailed out.Those few who stuck with
it upgraded to novice / tech plus....even had one
go to general.....all for an hour a week for ten weeks. Amazing.

Rote memorization is not on the same level as learning a fundamental concept thoroughly. Yes, there is some retention by rote, even enough to be useful (subjects like band and power limits come to mind), but knowing the answer to a question that asks which HF band to use when the MUF is a given frequency is not nearly as useful as learning the fundamentals of HF propagation as concepts, and as importantly learning and understanding how the various factors (solar activity, MUF, critical angle, antenna polarization and radiation angle, scatter modes, etc.) affect one another and combine to produce a certain type and quality of propagation.

I think the FCC would be doing operators a *favor* by closing the question pools, since people would have to study concepts and *understand* the theory well to pass the tests. The same folks would be happier later, ticket in hand, when the time came to actually set up and operate a station, and the learning curve of new hams would not be as steep as it is (listen to many of the questions asked on repeaters about basics, that in fact were on the exam the poser just recently took and passed, and you see this in action).

I have a pretty sponge like memory and remember the *wording* of many questions from the ARS exams [and others] I have taken, but I am very glad that I approached preparing for ham exams by using the ARRL guides, which I have hung onto because they are actually useful reference, because they treat their subject matter in thorough detail, and as a whole, instead of simply presenting the test questions with the correct answer highlighted and with only minimal explanation.

That is the difference between a textbook and a test guide. I have learned well the basics of propagation, antennas, safety, proper and effective operation, and AC/DC circuits from the ARRL guides (and books like them, such as George Grammer's "Understanding Amateur Radio"). Such reading prepared me first for the tests, then to set up and operate a station, and finally laid the foundation for further learning, understanding, and development in my hobby.

The Q&A style books certainly don't do the latter. If you use them you will wind up doubling your effort/reading later, since they do a poor job of really teaching principles. Even if the Q-pools don't get closed, whenever I can I urge that people avoid the Q&A type guides because you don't learn much from them that you can form generalizations from and then apply in particular cases.

We spend a lot of time debating license exams in terms of fairness, relevance, and their function as a filter. We ought to look at them, and change them as needed, more from the point of view on how well or poorly they prepare people to actually operate a ham station day-to-day, after the license has been granted.

How about the Uniden EXS9800?
900 MHz DSS
Digital answering machine
3-line caller ID display
Call timer

The CID feature actually counts the total number of calls received under each phone number. So far have 73 calls from telemarketers under 'unknown name' / 'unknown number' slot!

Check the Uniden website for factory refurb units. Currently listed at ~$142.

Felix,

I have a Watson 889 and a Watson 881. The 889 is the simple telescoping antenna with the knuckle joint. Both are decent on 800 MHz. The 889 is lousy on VHF LO. The 881 is decent on VHF LO but to put that into perspective, it is not as good as a Radio Schack telescoping scanner antenna (the $10 one) for VHF LO. Even better than the RS telescoping scanner antenna is a dipole cut for VHF LO - I use one made out of speaker wire and thumb tacked to a wall. The only place to get any of the Watson antennas is from Scanners Unlimited in CA - Glenn is the owner.

For overall performance, I prefer the RS $10 telescoping antenna but its construction quality is poor compared to the Watson which costs about $25 and $35 for the 889 and 881. I am thinking of getting the Max 800 which everyone says performs very well on 800 MHz.

Sorry to have missed this post Perfidious...Yes, I did study for and get my ticket and I save for and purchased my first radio for the sole purpose of community service in the form of Skywarn and storm spotting. I have gone on to providing net control for emergency nets when phone service is disabled, helping with local missing children alerts, a couple of public service events (bikeathons, parades). But, my premier love is for storm spotting and being able to be a part of a potential early warning to a community.

I think you would really enjoy ham radio. I encourage and would welcome you to our ranks. You can keep your chip, too. I did ;-) Oh, I don't talk on CB any more, because my dad has my CB radio. I plan on getting it back into the car, and I am going to use the very same antenna that I use for 10M and use an antenna switch alternately for either radio!

Hope you'll get some interest!

Kim W5TIT

>manufacturers are happy with this philosophy.
>Anything you get for nothing has no value. Think about it and you
>will know this is true. Anything requiring effort and truly earned,
>will be honored, respected, and nurtured. Why do we implement policy

Why do you say that? It simply is not true in many perjaps
most cases. I and most people I know value things based on their
uslefulness, and/or usefullness vs how hard it was to get. In other
words on some type of value.

>that will degrade the value of a license? Why not, just once, make it

Indeed these changes be they right or worng in conception do
INCREASE the real value of the lisence if perhaps not to yourself then
at least to many people. The near total failure of the CW side to even
seriously consdier this line of thought, is certainly a reason that
that side of the debate has not been able to muster any arguement to
really sway the people that count in this matter. The FCC

>something difficult, something earned, something valueable?

The value of the license is in what it allows one to do. In
those terms all licenses have and are and must continue to increase in
value, when any of the following happen, technology improves, numbers
increase or spectrum is enlarged. If you don't understand that value
of the license is in what you can do on the air then aren't you really
missing point of having a license?

As to earned or difficultity these seem to me be out of
place. Diffculity, the Government is NOT in the bussness of dealing
out S&M as the Dominant partner, (it manages this at times but that is
not one hopes the purpose of Governance. Earned, why should I earn
the right to use what should never have been so restrictied?
>I no longer believe that the ARRL is promoting this hobby in a manner

Alas here I agree with you. I can see where bythe ARRL is
doing much of anything to promote this hobby, at all, and without
regard to the manner in which they do so

Not likely, as the radios in use on the trunking system get programmed with control modes only for the trunking personalities and receive information on adjacent sites in the data stream. The only error YOU could have made was in programming the conventional modes.

>- where is this new 14th site?

See below.

> Also, none of us remember going to any City sites to add a "21st"
> frequency"!!!

Just a fluke. Thought I heard something that sounded like the city on it. However, I do know that there is equipment to add two more simulcast sites to the system.

Simulcast Sites
WNVL283 / WNZY850
856.2625 856.4625 856.7375 857.2625

Those that think "posessing" a modified radio is ok if you only XMIT on your licensed channels are wrong. There have been many cases where the FCC confiscated radios mereley because the were modified.
One famous case was in all the ham magazines about 2 or 3 years ago. Seems a licensed ham was deep in the mountians (Califorina, I think) and broke his leg. He couldn't raise any ham repeaters on his Kenwood "modified" HT and as a last resort, knowing it was an emergency, dialed up the local sheriff's repeater, used his call sign & explained the problem. The got a chopper out to him & got him to a Hospital, everything OK. 2 Weeks later he was called in to meet w/ the local sheriff & men from the FCC & told to bring the radio. The FCC told him to surrender immediatly his Kenwood radio or "else". It was explained to him that he was NOT in trouble for using a radio freq during an Emergency, which was legal, but now that they were aware he had a radio modified to take it "out of type approval status" for amateur use ,he could no longer keep it unless he had a MARS or CAP permit. It was explained that using the logic that it's OK to have such "mods" as long as you don't XMIT would allow for example, every CBer to Mod his CB for a hundred otherwise illegal channels, waiting for that "emergency to happen", or allow every tow truck driver to have all the police and Ham repeaters in their radios, "for emergency only" , of course. This is why the Ham gear can't be imported with the "mod" already done, & The manufacturers can't give out the mod info unless the request is from MARS/CAP operators only...../////charcoal lighter fluid is now spread////.....

Hello All,
I have a like new Pro 92 Hand Held Scanner for sale
you know the one that does everything
Motorola
EDACS
LTR
etc...
Has the abllity to scan trunked and conventional at the same time
It works and looks new
I have all the original accys
Plus Leather Case and wall wart charger for rechargeable batts or
running of AC
I would like $300 for all Plus shipping in the U.S.
For more info,questions or for PICTURES
contact
2nzster@netscape.net
thanks Tiny

1504. FS: Racal 4 channel voice logger

From: n3jpu@erols.com
Message-ID: <387bd0be.5543829@news.erols.com>
Source record: 96690

FS: Racal 4 channel voice logger

4 channel dual-deck voice logging recorder. Records up to 6 hours using standard C-120 cassette tapes and a full 12 hours using the sequencing of the two tape decks. Built in VOX and time stamping. The four outputs can be independently selected for playback audio. This unit is in very nice condition.

Service manual and 2 spare mainframes if needed, both complete except one has missing heads, the second has missing decks.

Make an offer.

The Technician is by definition, an entrance level exam, and has been for 10 years. The General and Extra are more than entrance obviously, since they require more knowledge to pass. However, they are entry levels to their enhanced privileges. In no sense are they graduation certificates, or proof that someone has achieved something great in technology development. Amateur radio never was meant to be a college degree. The only applicability of an amateur radio license to the commercial world that I know of is that an Extra will get you a *Third* class NARTE Technician certificate.

Larry,

How many of these towers are used in the Portland/Vanc
area for the police?
Do you have a reliable source for all of the frequencies
that are used on the trunking system?

Larry R. Johnson wrote:

>

Well, sort of true. There are still states that prohibit scanners, and
HAMs as a 'general' rule are exempt at the state level. But NY for
instance will allow HAMs to have scanners, but unless something
has changed in the last 2 years, they consider HAMs in violation
if they have any police frequencies programmed into their rigs or
scanners.

Of course, if the HAMs are tracking a police jammer, with PD knowledge
and/or assistance, there shouldn't be an issue.

I have heard this is possible. I have a Pro-90 and the local police use a Motorola trunked system. They are going to MDT real soon. Any links out there to help me out would be greatly appreciated.....Thank You for your help. Eric G.

The police might, but apparently the courts do not draw such a distinction.
A Suffolk County judge ruled that a ham license gives a blanket exemption to
licensed hams from the provisions of Section 397. [People v Beatson (1997)
Suffolk County First District Docket #44993-97S]

Maybe now you'll have to:

a) conduct interviews,
b) hire college graduates (from a relative field), and/or
c) hire experienced broadcast engineers

Eric,

Many people are nervous talking about MDT because of the possible illegality of monitoring MDT. Bill Cheek is now up to his legal neck over the sale of data slicer/software for MDT reception.
The good news is Bill Conduit doesn't believe it is illegal and will be more than happy to help you out and probably send you any software or tech help you need.

Where are you Maynard? Help Eric out and send him the software and/or post it to alt.binaries.radio-scanner. Come on Bill, you can help out the scanner users and finally back up your talk about no laws against MDT.

<mircuser1234@yahoo.com> wrote:

: You CAN NOT own any transmitter that you want to. Simply posessing a
: transmitter for many frequencies can land you in jail.

One word:

Wrong.

Let me say it again real slow so you understand: W-R-O-N-G. As in "incorrect".

Ownership of a radio that's capable of transmitting on any given frequency
(I don't care what frequency that happens to be - pick one out of thin
air. It'll be just as good as any other) isn't regulated in any way,
shape, or form, by any angency, be it federal, state, county, city, or the
local dogcatcher. NOBODY, let me repeat that: *NOBODY*, from the feds on
down to the previously mentioned dogcatcher, has any authority whatsoever
to regulate what radio you may own, regardless of what frequency it's
capable of transmitting on, anywhere in the USA, and there isn't squat
that any law enforcement agency can legally do about it.

That's not to say that some overzealous pinhead with a badge won't attempt
to abuse his limited authority and take it from you, but that's an illegal
act in and of itself, for which he can be prosecuted or sued.
He/she/it/they have no legal leg to stand on if they try, but many people
are too much like sheep to put up a stink about it if it happens.

TRANSMITTING with it if it's using a frequency you're not licensed for is
a whole different question, and for that, you can get busted.

i have an optocom and r7000 receiver and i cannot get the r7000 to reaction tune using the ci-v port...

how the hell do i set up the 7000 for ci-v??

never did have the manual, noticed there is a remote p/b on the front...guess that has something to do with it.. then 2 remote jacks in the back...

can someone clue me in how to get the 7000 into "remote" mode to allow tuning via my optocom box?

thanks

reply directly, may miss otherwise

> had used that fact to build my resume.

The ham license has never been proof of electronics skill or knowledge, Dick. When you got the jobs you describe above, did you do so without any further training? In other words, did the radio/tv repair shop hire you without giving you any training after you were hired? Did the military hire you without any further training?

If they had to train you, then you cannot now claim that passing the ham license exam was evidence of electrical skill since those organizations did not take that license as proof of electrical skill. For those organizations, that license was only proof that you had some basic understanding of basic electronics and therefore would be easier to train than another person.

And the ham license of today still serves that purpose. However, it plays less of a role in the hiring process today simply because radio plays less of a role in an electronics career today. Years ago, because of the greater role radio played in an electronics career, many more organizations were willing to give credit for any radio training (no matter how basic). Since radio plays less of a role today, fewer organizations give that credit (even those who did years ago).

I also think you're being a little disingenuous here, Dick. After working at a radio/tv repair shop, graduating near the top of your electronics school class, and working in electronics in the military, I really doubt that the ham license really played that much of a role in your later employment at that "good technical job."

The simple fact, whether you want to admit it or not, is that the ham license exam has always been an extrance exam into the world of hobby radio (hobby radio, not professional or commercial radio). That is the way the FCC designed it many years ago, and that is also why there have always been other, much more difficult, license exams for professional or commercial radio personnel.

With that in mind, the existing license exam system serves its purpose well.

I understand it real well, In fact it's an 8wpm barrier but you may
have got stuck at 10wpm. Morse code does in fact have something to do
with radio, We dont send it over the phone do we? But I do agree with
most of the post in here that morse at present does not make ham radio
what it is today. Maybe 30 or more years ago, but not today. Good luck
getting passed the barrier and I hope I dont have that problem when I
get there which I know I will! :(

1533. R8500 and telescoping whip

Newsgroup: rec.radio.scanner
Date: 2000-01-13 00:00:00 UTC
From: Bob Rodriguez <robertr@netcom17.netcom.com>
Message-ID: <85lkavcdc1@nntp4.atl.mindspring.net>
Source record: 96469

I've used several telescoping whips with the ICOM 8500:

Smiley SuperStick II (best, especially on FM and 108-175 mhz, ok on UHF)
Radio Shack PRO-2006 (good on 30-54 mhz and shortwave, very poor on other bands)
Grove ANT-19, Watson SuperGainer (OK on UHF and FM, not recommended otherwise)
Grove Active Duck (amplified antenna mainly good for shortwave and AM)

These can all use a BNC-to-N adapter above 30 mhz, or BNC-to-PL259
(below 30mhz). To allow the antenna to stand upright, you may also
need a right-angle BNC adapter. Though not a whip, I'd also recommend
the coax antenna from C. Crance for about $20, it's especially good
if you do FM or TV dxing since it's directional, and also does very
well from 108 mhz into the UHF TV bands.

Mike be careful before you get someone jammed up.

I'll have to reread the NY Vehicle and Traffic law, but from
memory it simply states no one can have radios capable of
receiving police calls, no distinction whether you have freqs
programed or not, just can't be CAPABLE of receiving police
freqs.

Also, you can have scanners, etc. capable of receiving police freqs
if you have a letter from the Sheriff, etc. stating its ok.

Thats what I remember of the way the laws written, interps and
enforcement are of course another matter.

Best, RC

Mike:

Be careful before you get someone jammed up.

From memory, NYS makes no distinction and forbids
having a radio capable of receiving police transmissions,
whether or not the freqs are programmed in.

NY law allows these radios if you have a letter from the
Sheriff, etc. oking it.

I'll get the exact language if you want.

Best, RC

The ARRL has been passing out code proficiency wallpaper for eons.
w1aw broadcasts code tests up to 40wpm, other organizations do the
same thing to higher speeds. The difference between a piece of
wallpaper nobody sees and a distinctive callsign is that the callsign
is the first and last thing the world hears when you jump on a freq.

I have an R-2 and I also had the same question... I went the $$ route... I just ordered an SMA type antena (Comet SMA-501 $29.95 from AES).. Even though I have several BNC antennas I decided that putting the BNC (female) to SMA (male) adapter would make the R-2 look "ugly". Notice the order of the adapters (which agrees with what Grove sells)... BNC antenas are "male" and the R-2 has a "female" SMA plug...

I recommed you to invest in a SMA antenna though..

Regards

Rafael (KE6JSR)

I didn't know that the Optocom could reaction tune the R7000 but check your baud rate is the same as the Optocom. The owners manual deals with this. The remote switch on the front is for a optional remote control. The one remote jack on the back is RECORDER REMOTE, the one only labled REMOTE is the CIV port.

I just recently bought the Optoelectronics 3000A on Ebay for $207.50 and it sells retail for $359. I was willing to pay up to 300, but nobody else bid against me, so I got a great deal.
Take a look there and search for frequency counter. Because of their cost, i would definitely go used or non dealer.

Not at all....signal loss on 100 ft. of RG6 coax cable at 1000 mhz is about 7db. Including connectors and 10 ft. of cable your losses would be at the most 1.5db at the higher scanning frequencies, such as cell and trunking around 800 mhz., nothing to even worry about.

>> You say it still ain't so??

>It is not DIGITAL spread-spectrum and they do not claim it is. For reliable
>security, the phone must be DIGITAL.

There's analog, digital and s-s. Digital is NOT s-s, but it's better
than analog.

Digital is the modulation on the single-channel carrier (the carrier
is only on 1 frequency, selectable by the user in most cases). Spread
spectrum means that the carrier is spread across many channels at once
(or almost at once). The modulation can be anything, because only the
one receiver that is receiving that transmitter can follow its
pseudorandom spread.

BTW, I like my Radio Shack 43-728, but them, I'm prejudiced toward
Radio Shack. 900 Mhz, dss, digital answering machine, caller ID and
call waiting ID.

Sells aluminum foil, though.

"Tom 44, you have a Ford sedan coming your way with aluminum foil all over his hood. I think his brake light is out."

I _have_ "blown up" a speed radar.

The MP's at Fort Gordon used to park at the entrance to non-com housing and catch folks speeding home to Mama. They had these old radars, with the RF section on the driver's side window and the processing section on the seat. My 75 meter antenna was on the curb side of the car, and I ran 500 watts PEP. So I'd just call CQ 75 when I drove by,and the induced RF would fry the processor. I think. They'd always go away, anyhow.

In another few weeks they'd be out there again, repaired and the whole thing could repeat itself!

Can't do that with modern units, though.

Cortland

I have the Max 800 for handhelds and I rarely use it because its
performance over a stock ducky is negligable, I have never tried the
Watson so I can't comment on it. You might try picking up a cell phone
antenna from Rat Shack and also a TNC to BNC adapter so you can mount it
on your handheld. I heard this set up works pretty well and I am
probably going to try one also.

> Rich, my hat is off to a job VERY WELL DONE. You have my admiration,
> and I am sure that of all the folks who love this hobby.>

I'd like to second that emotion.

As a definite newbie, www.strongsignals.net
is an invaluable resource to learn and become increasingly interested in this hobby. Producing such a fantastic site must take countless hours in design, research and maintenance. All of us who benefit from all the hard work are truly thankfull to you, Rich, for providing us this resource.

In addition, Rich has taken the time to answer my Newbie questions on this board. Normally, people with years of experience in a field become very tired and resentful of the repetetive and (often) silly Newbie questions. By answering these questions in his thoughtful and respectful way, Rich proves once again what a gracious ambassador of this hobby he truly is.

Thank you, Rich.

: (not in communications...yet) I could babble on about injustices forever.
: I shall save you from that. (whew!)
:
: I'm sure some (or many) of my polictical views intertwine with radio, as I
: hear or see hams bringing the 2 into the same arena. Would I help local
: police find a missing kid in the woods by supplying communications if
: needed? No. I would however loan them the equipment. I would also help
: them search by horseback.(been there done that) Do I think my equipment
: would be returned to me in the condition loaned? Probably not.
: Are there exceptions? Of course.

Remember, many hams are volunteers in their local Emergency Management
Agency or with the local Red Cross.

: If someone stole my gear, would I call the police? No
: Would I get it back if I did? No If they did recover it would it be
:returned to me? probably not. (at least for some time (evidence etc))
:
: Will someone steal from me here? NO
: Would my neighbors protect my property? YES
: Would they call the police? uhm???
:

: > While an extreme scenario, you may feel differently about
: > that jammer disabling police frequencies if the ability of
: > the police to save someone's life (maybe your own or
: > someone you love's) was impeded by some jerk thinking
: > he/she is being funny.
:
: I think that I have paid dearly over the years, the police should (and
: probably do) have the equipment to do the task themselves. If they do not,
: maybe the police agencies ie: CHP should not spend $3000-$4000 each on
: light units for their cars, and invest in fox hunting equipment.

The amount of training that it takes to be good at DFing is not something
that most law enforcement agencies want to spend for. What makes a
good street cop isn't the same set of skills that it takes to do the
services
that hams provide. The same goes for the large number of military
reservists
who are providing intelligence gathering assistance to the police.

: possibly the US Border Patrol could loan them theirs, as they do not
: really have need for it.

The Border Patrol has a Signal Intelligence gathering units?

: Either way, I use the bands allocated me to converse to/with others, to
: learn, and to save myself phone bills, postage...etc. Not to specifically
: help my, or your community. I did not intend to become a public servant.
: Did you study for, and get your ticket....did you save, purchase or build
: your station to help the comunnity? Was that you're initial intent? We
: have a neighbor lives a few miles away, my daughter talks to her on 11
: meter. Our neighbor is a toll call.

The primary mission of the Amatuer Radio Service is to provide
public service.

: My father lives in CA as I used too. One of us saves money with radio.
: I've met some real interesting folks on the air...that was my intent.
:
: Somehow I think that's okay. Yes?
:
: I suppose if others want to do other things that's okay too. Your point
made.

As if you will be able to stop us.

: |> I do not see the above as grounds for foxhunting illegal transmissions
for
: |> the police, on police bands.
: |> ...
:
: Well, foxhunting has no necessary legal connection with having a
: Ham radio license. The ham license is related to your permission to
: transmit. Anyone can listen without a ticket.
:
: The License may make the results of your foxhunting carry more
credibility,
: but anyone could take a scanner, antenna, attenuator, etc. and hunt down
: a signal.
:
: (Yes, I know some states restrict listening to police frequencies, so
: this doesn't strictly apply everywhere.)

Hams are exempt in all states from laws forbidding scanners in cars.

: A large part of the difficulty in hunting down a jammer can be to
: 1) find a place where you can hear him on the input frequency if
: he's jamming a repeater or 2) getting close (e.g. an apartment building, a
: block, etc.) If I were to be involved in such a case, I might try
: to just narrow it down to a small area and leave it to the police
: to narrow it down from there. I wouldn't want to have the court
: case depend on me as an "expert witness".
:
: The other worry would be if you gave the police some good information
: and they then go after the wrong person. e.g. if they break down the
: door of some innocent nearby person who has an antenna, but isn't
: the person doing the jamming.

>Hams are exempt in all states from laws forbidding scanners in cars.

Well it has been some time since that was raised, but the
reality is that the federal preemption is for transcievers...NOT
for scanners. Now the argument can be rasied as to a
scanner being just part of a transciever, but that hasn't been
tried anywhere that I know of.

The few states that forbid scanners in cars all exempt hams
in the state law itself...NOT by federal pre-emption.
Most states do not have any laws against scanners
in automobiles by anyone.

Cheers,

> --
> 73, Cecil, W6RCA http://www.mindspring.com/~w6rca

I think there's widespread confusion between the ticket (and associated
callsign) and the hard work it may have taken to earn it. It's the FCC's
job to make sure you meet some *minimum* requirements they've set up
to get on the air, and it should be the ARRL's job to recognize and award
outstanding hams
for their achievements.

It should be up to the ARRL and not the FCC to develop awards for
hams for proving you're achieved some noteworthy accomplishment.
For example, they should have awards (if they don't already) for
finishing (say) 50 QSOs at 10, 13, 15, 20, 25, 30... WPM, presumably
without a QLF. :) There are already awards where you can nominate
exceptionally
good operators, and presumably public service awards would work the same
way.
I see no reason why you can't brag about a 30WPM award the same way as you
would a DXCC or your 2x1 callsign. Am I totally all wet on this?

The bottom line is the FCC doesn't care how hard you worked,
nor are they interested in certifying your skills to other hams or
impressing your buddies with your high-class callsign.
They just want to be sure you pass muster. They issue the
ticket as a permit to allow you on the air, plain
and simple. You meet some minimum standard, and you're in just the
same as the guy who got every question right and 100% copy on the
code test. (This "Pass/Fail" phenomenon at the DMV explains a lot about
what
passes for driving in Calfornia, but that's a whole other digression.) ;)

If the ARRL was so eager to nurture and protect the Code, they ought to get
off their
collective butts and find ways to recognize hams who DO use the code. The
FCC
doesn't (and shouldn't) care about our internal squabbles.

Panasonic does not claim that the phone is DIGITAL spread-spectrum and it is
not; it is analog spread-spectrum.

For reliable security, a cordless phone must be DIGITAL.

As I have already said in this thread, the Panasonic 2.4 ghz phones are
ANALOG spread-spectrum, NOT DIGITAL. Digital is necessary for reliable
security.

>My friend has the Sanyo
> 900MHz DSS phone. Is this one also only -digital- in one direction?

The Sanyo should be completely digital.

The Panasonic is not digital in ANY direction. It transmits at 900mhz in one
direction and 2.4 ghz in the other, both analog.

I do know it

> works astoundingly well.

The Sanyo CLT-986 was the top-rated phone on Deja and several people claimed
that it had a longer range than the 2.4 ghz Panasonic.

Not only are you full of shit, but your use of the english language sucks.
Also, a hand held radar unit wouldn't "blow up". There is a fuse inside the
unit. That way when you target a plane or other high speed object, the fuse
blows. Although this doesn't mean the unit may be operational after doing that.

> Totally irrelevant.....a ham radio license is of no commercial use.

It's a certainty that it will never again be, but it has
not always been so. As a high school kid I got a job after
hours repairing radios and TVs *ONLY* because I was a ham. I
got into military electronics, and graduated near the top of
my electronics school class, because I was a ham. Later I
got a GOOD technical job in radio - because I was a ham and
had used that fact to build my resume.

> This is *Amateur* radio, not commercial/professional/broadcast/PCS
> whatever.

Yep. Only a mere shell of its former self.

> The license is NOT a graduation certificate, but rather an entrance
> permit to the hobby/service.

You jokers have regurgitated that tired old bromide until
even the kids at the FCC believe it, now. But Hey, what do
they know, they just work there, right?

If you prefer to view your EXTRA class license as an
"entrance permit" to the hobby, it tells me that you got it
for free. Most of us did not, and DO NOT. The FCC, at least
30 years ago, considered an EXTRA class licensee to be the
only expert class of ham. The fact that he was knowledgeable
enough to score a passing grade on their tests was proof
enough.

Congratulations on changing their minds. Henceforth there
will never be anything other than "entry level" class hams
licensed. And that's exactly where most of them will stay.

PRO 2004

Electrically a 10, cosmetically an 8 because previous owner drilled some holes in the case for some mods he did, which he removed before selling to me. It still has the popular mods, including the dimmer switch changed to an on/off switch.

20-014 Antenna

This is a brand new, never assembled, RS 20-014 antenna. It covers 25 to 1300 Mhz.

The owners manual is the one I bought direct from Radio Shack, which is a copy. I'll also include the service manual, also a copy, that I purchased from RS.

$250.00 plus shipping from Bellflower, CA for the whole mess, or I'll trade even for a new BC245XLT.

E-mail me if you'd like more info.

> reading your question right?

Well, I understand your point, but you may not have tried this yourself.
There is a definite 10wpm 'Wall', I am there now. This is caused when you
are trying to condition yourself to use the 'sound' of a character to
recognize it vs. interpreting a collection of dots and dashes. As the mind
fluctuates between modes, you hesitate and start missing characters.

I am earnestly trying for my 13 or 20 wpm, but still think Morse code has
zero to do with radio.

Please stop crossposting this to the sat group.

It is NOT irrelevant. At least it wasn't a few years back. I know from
personal experience. I was hired at a job once over another candidate,
because in addition to my other qualifications, I had a ham license. I
was told by the hiring manager at the time, that having a ham license
means that you actually "live" this stuff, and don't just look at it as
a 9 to 5 job, which they thought, meant a better employee. This was back
in the days when hams still built alot of their own projects, and the

title of "ham radio operator" was synonomous with "electronic tinkerer" or "freelance engineer".

While a ham license is not a true accreditation, it tells something about the person's goals, and interests and gives the hiring manager some clues as to whether or not the person would make a good technical employee. Of course if you are in a field other than electronics, then it's probably meaningless.

Today, with the preponderance of appliance operators, who really don't know much REAL theory, I would tend to agree that the license no longer stands for much.

That's interesting.....I didn't know we had a site up at Bull Run running. But then too, one of the "experts" on here with a web page about all the freqs., etc. on the Portland system told me that there is *NO* encryption (scrambling) on the Portland system. Funny, I just did up a 250-mode, 15 Zone MTS-2000 type III (and an MCS-2000 type III) with encryption. Wonder why we can't talk back and forth unless we load the code with the keyloader first?

Sometimes I guess I have to check here to find out what I should be doing at work........

Not likely, as the radios in use on the trunking system get programmed with control modes only for the trunking personalities and receive information on adjacent sites in the data stream. The only error YOU could have made was in programming the conventional modes.

- where is this new 14th site?

See below.

Also, none of us remember going to any City sites to add a "21st" frequency"!!!
Just a fluke. Thought I heard something that sounded like the city on it. However, I do know that there is equipment to add two more simulcast sites to the system.

Simulcast Sites

1594. BC 145XL Low Volume

Newsgroup: rec.radio.scanner
Date: 2000-01-13 00:00:00 UTC
From: smithrk@vt.edu
Message-ID: <85kou1imt1@solaris.cc.vt.edu>
Source record: 96539

Anyone have a clue of what goes wrong with the audio level of a Bearcat 145XL? I have a personal knowledge of 3 units that over time the audio output is very low. Can anyone help? Thanks in advance.

1595. Alinco DJ-V5EH -- anyone with personal experience?

Newsgroup: rec.radio.scanner
Date: 2000-01-13 00:00:00 UTC
From: ib2600@worldnet.att.net

Came across a site that sells unblocked versions of many scanners,
based out of Canada, and ships guanteed to the US. I'm intrested in
the scanner mentioned in the title, the Alinco DJ-V5EH, and the IC-R2.
I've read some great things on the pocket scanner R2, but this is
going to be the only scanner I own. Does anyone have anything
intresting to say on the Alinco DJ-V5EH?

|>
|>

No. The FCC issued a directive (not sure of the correct legal term)
that says local authorities cannot enforce laws restricting the possession
by hams of ham transceivers that can receive police frequencies.
Check with the FCC for correct wording of the FCC statement.

i.e. the FCC not only doesn't make it illegal, they forbid the locals
from making it illegal.

However, you may have to spend lots of time and money in court to get
it back. Remember, the cop who wants to take your equipment has a gun.
He also probably won't suffer any serious consequences if he takes your
radio and they have to give it back later.

I think the procedure is that you must first go through the FCC's appeal process, then you can take it to federal court. Just another Catch-22 situation.

If you're an experimenter, Joe, you might want to try adapting a design for a 1296 MHz loop yagi. There are some good looking plans in my old (1991) copy of the ARRL Antenna Book beginning at p. 18-34. Scaling everything by 75%, and reducing the diameter of the boom to 1/2" should come very close.

Good luck,
Charley_Harp@alum.calberkeley.org

1606. DCS vs. CTCSS: Are they different and if so which is used more often

Newsgroup: rec.radio.scanner
Date: 2000-01-14 00:00:00 UTC
From: fjsieder@microimm.mcgill.xae
Message-ID: <387f5995.1119896295@news.mcgill.ca>
Source record: 96251
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi,

Among the many things that I'm trying to learn about scanners is tone coding via CTCSS/DCS. I have seen that some scanners that I am considering (eg. Icom R2) only support CTCSS whereas others mention both. I'm assuming then that these are independent systems and I'm wondering if one of these (eg. CTCSS) is used much more commonly than the other? Would it be strongly advisable to get a radio that supports both rather than just one? If I live in a large urban area is this a feature that is essential (I wouldn't mind getting the Bearcat 245XLT but its lack of this feature is a concern...is this a reasonable concern?) Is this technology more important for distinguishing/selecting between different agencies using the same frequency or for reducing intermod from pagers, cell phones... which don't use CTCSS/DCS. My understanding from a few FAQ's that I have read is that CTCSS and PL are synonymous (different trade names for the same technology?) and the same applies to DPL/DCS.

Cheers,
Felix

I did, with this result:

Radio Operator/Communications Analyst in Quantico, Virginia
USA

Key Role
Provide Morse code and radio operator support for key
government clients.

Qualifications
HS diploma
3-5 years of experience
Experience with voice, FSK, and packet communications
Experience with Morse code at a proficiency of 18-20
groups per minute or Extra Class FCC ARL
Experience with radio theory, Q signs, and radio
equipment

E-mail your resume directly to Mike.

I'd bet they have trouble finding a young ham to take this
job.

If it doesn't have "spread spectrum" listed in the features you can
just about forget about security. Most of the cheaper (below $75)
900mhz. phones that I've seen don't have this. The "digital security"
that they list on the box has to do with people not being able to
drive by your house with a handset and make calls off your base...

Scott

Well, I'll tell ya what...

Why don't you try interviewing at HP and tell them that your qualifications include being able to design a Hartley oscillator from memory and that you can send and receive 20WPM code proficiently. See how far you go...

1613. Using Relm HS200 or Icom R2 in urban areas-Is intermod a large problem

Newsgroup: rec.radio.scanner
Date: 2000-01-14 00:00:00 UTC
From: fjsieder@microimm.mcgill.xae
Message-ID: <387f70c5.1125832020@news.mcgill.ca>
Source record: 96258
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi,

I've read quite a few good things about the Relm HS200 and Icom R2 but due to the double conversion circuitry on the first and the high sensitivity of the second it seems that intermod/interference can be a problem. I am considering purchasing either of these (via the web) and wondering if these radios are ill suited for use in a large city (Montreal)?

Cheers,
Felix

> is this a feature that is essential (I wouldn't mind getting the
> Bearcat 245XLT but its lack of this feature is a concern...is this a
> reasonable concern?)

If you can afford a receiver that does both, you should get it because DCS is becoming more common. There are a limited number of CTCSS tones available, and in large urban areas it is especially important to have the flexibility of DCS available for radio users. DCS uses a subaudible datastream to identify particular users' transmissions to the intended receiver. It is less prone to false squelch opening than CTCSS.

The BC-245 does not have CTCSS or DCS capability, but can track Motorola and Ericsson EDACS trunked systems. I have found my BC-245 to be disappointing as a conventional scanner in an RF-rich environment like downtown Rochester because of its lack of CTCSS/DCS squelch, but it is an excellent trunk tracker anywhere.

The only handheld scanners (not transceivers) that offer DCS decoding are the Relm HS-200 and the Radio Shack PRO-92 (and maybe the 94). The PRO-92 is the only trunk tracker to have this feature (again, maybe the PRO-94 does, too). If a scanner supports DCS, you can count on CTCSS capability as well.

> don't use CTCSS/DCS. My understanding from a few FAQ's that I have
> read is that CTCSS and PL are synonymous (different trade names for
> the same technology?) and the same applies to DPL/DCS.

CTCSS means Continuous Tone Coded Squelch System, which is the generic technical name for the subaudible squelch technology. PL is Motorola's trademark "Private Line" for CTCSS. Another less used trademark is "Channel Guard" by GE (now Ericsson).

DCS means Digital(ly) Coded Squelch, which is also a generic name. DPL is "Digital Private Line" - a modified version of Motorola's trademark. I don't know for sure whether or not Motorola has actually trademarked "DPL" or if it was made up by customers.

From: John Warne <warnejw@bellsouth.net>
Message-ID: <387F8389.346D@bellsouth.net>
Source record: 96265

Those frequencies were still good on the last mission. Many persons in Florida monitored the transmissions during EVA activities when the shuttle was in line-of-sight.

I could copy several minutes during passes on my Yaesu FRG-9600, with a Grove PRE-5A and a RadioShack discone antenna. Also could hear them on my WinRadio 1500E.

The signals were too weak to break squelch, so you had to be really litening during predicted passes when EVAs were in progress.

Never copied the shuttle-to-suits transmissions, but both astronaut suit frequencies were caught.

Send complaints about Toilet Boy to abuse@home.net.

Toilet Boy the Liar posing as one of his many alter egos
williarsch@nandomail.com whined:

Weak and pathetic FOOL!

You keep trying to dodge the issues when confronted them head on and
when you can't you resort to phony IDs. Every time you try one of
these lame stunts Toilet Boy, you keep proving my point. You are a
pathetic liar and a loser.

Remember this massage, the one you keep trying to avoid by pretending
it doesn't exist? Maybe this'll refresh that excuse for a brain.

Glenn wrote:

> Easy as a book to read, isn't he? He will ignore this, he has
> admitted to getting tossed but he has 7 different excuses and
> not one is the fact that he behaved on Fido like he does on
> the Internet.

Yes, you Toilet Boy --------------|
\/
What's amazing is that I've told him several times that I've been
baiting him in the past. Yet, he plods on like nothing has happened.
I think it's a variation of the ignore it and it'll go away move.
He is in such a state of denial that he can't see just how transparent
he is and that others see him for what he truly is, a pathetic loser.

> Yep. On the mark here Richard.

Toilet Boy makes it so easy it's almost as ridiculous as he is.

> He can smoke a good Micor or power supply.

Sadly, there are people who don't know any better and they let Toilet
Boy butcher their equipment. But, when it comes to smoking, I hear
he's *the* darling in the public bathrooms of the Portland area
smoking those white owls...

> Degrees, plural. Toilet-Boy recently claimed to have under grad and
> graduate degrees. Yeah, he certainly comes off as educated compared
> to a rock). He will ignore this too, he can't come up with it.

Yes, this is about you Toilet Boy --|
\/

Anytime he's caught dead in one of his many lies, he always ignores the comments. He's very predictable on this account. As far as educated, his total lack of grammar and spelling skills shows he probably didn't finish high school. What's more, his limited memory retention proves him to be a person of very limited intelligence also. Without a doubt, his demonstrated behavior has confirmed these attributes.

> He has his Internet world Richard. The last 4 years he has spent most
> all of his Christmas Day and Thanksgiving Day on the NGs stalking Cheek
> or anyone who doesn't support Toilet-Boys antics. The boy is worse than
> a fraud.

Now that Cheek is preoccupied elsewhere, Toilet Boy is in a real frenzy. Without that focal point, he's adrift in a sea of his own self-inflicted psychosis. Toilet Boy is a perfect example of a neurotic underachieving emotional retard who's ambition far outstrips his minuscule ability.

Ham Radio University - HRU2000
Babylon Town Hall Annex
Phelps Lane & Miller Ave
North Babylon, NY
Sunday January 23, 2000
9:00 AM - 2:00 PM

This is a special day of education for amateur radio. Many ham radio Clubs and organizations from the New York City-Long Island Section will have information booths. This is your opportunity to meet the local clubs and organizations and learn their activities, meetings and membership. There will be a free tune-up clinic, DXCC & WAS card checking, eye-ball qso room, a full VE session along fifteen technical forums with guest speakers from the NLI section.

Donation: $2.00. Spouses and children under 12 will be admitted free.

For more information via Internet: http://arrlhudson.org/nli/hru2000.htm

Contact: Phil Lewis N2MUN (631) 226-0698

Dave,
I had a similar problem until I discovered that I needed a null cable from the 245 to the modem. After that, it worked fine.
My only gripe about it is that I had to hunt down all the freq's it programmed into my unit (some 160 channels).

Sure, I guess so. The charter which is posted monthly says for these newsgroups it should be radio related. Cell phones converted to 902 Mhz. Amateur Radio band are radio related. Cell phones in themselves are radio transmitters also. That should be explanatory enough, the bozo I responded to was bitching about my post saying it was "anti-scanning", I don't know what drugs he was using when he came up with that one, but they must have really been good. How converted analog cell phones for Amateur Radio is "anti-scanning", I'll never know!

I don't have either, but I do have a Comet CH-32 "Miracle Baby", and it works great on 800 mhz. It's about 2.5 inches long, and very durable.

I use it on my trunk tracker, Opto Scout, and R-10. Actually, I have two of them.

I don't think the question pools are available for purchase.
On the other hand, our volunteer examiners probably have a bit of a
collection from all the exams they've run in the past.

I haven't heard of corruption in the VE process here, and we don't
have the medical exemption for Morse either.

Lee -

If 'looks' are an issue, you might consider a Diamond D707E as an alternative to a discone. It's pricy compared to a discone, but it's only a single vertical white stick about a yard high. I have been using one for a year or so and like it a lot. You can see it at http://www.rfparts.com/diamond/ -- I got mine from HRO [I don't think it's shown in their current catalog, but I don't think it was when I ordered mine either....]. I think the 505 is the same but without the fiberglass outer tube.

Thanks for the info, John.
Now I know my problem.
I've always tried scanning the shuttle "UHF" frequencies on a Pro-2006
(not the most sensitive radio).

Those are indeed cardiac rythm telemetry receiving antennas, for the 75-76 mHz range. We have a new system at work now, HP Kayak server based, with rubber ducks sticking down through holes in the ceiling tiles. I hear that due to the increased bandwidth of HDTV, the telemetry spectrum MIGHT be moved this decade to prevent TVI to the monitors, but its just a matter of reprogramming the PLLs and its a few years off IF it becomes necessary. I've never heard the signal but I've read that its a warbling tone with a different pitch depending on whether the system is analog or digital. BTW, if you decode the patient info (name/age/sex etc) its illegal! There are strict patient confidentiality laws in place regarding this!

To clear up some confusion,

I went to court to support a friend and as a witness, The court dismissed the case due to the fact the Galaxy Saturn radio was not in Transmit mode when the local sheriff and Federal officers served the warrant. Lack of evidence that pointed to an individual that told the sheriff's office of the radio's existance only. There must be solid proof that an individual has transmitted from said radio via transmitter fingerprinting (Not of your fingers). It is only illegal to Operate Non FCC Compliant Equipment in an illegal way. You can have your Galaxy Saturn, Texas Star 1600 or whatever hooked up and turned on, but the instant you push the mic button, you have committed a crime. Do not let others trick you in to believing that this equipment is illegal to posses, only that it is illegal to transmit with!!

By The way, This was a federal court in San Francisco.

Hello All,
I have a 16 channel CHRYSTAL scanner for sale
model CE-100
it is 8 Vhf and 8 Uhf channels
actually works pretty good
except for channels 1-3-4 the lights do not work
I have a handfull of rocks to go with it also
It has seperate antenna jacks for Uhf and Vhf and external speaker
can be run off of 12 volts dc or Ac with included cord
The bands are 148-174 and 450-470

This was used everyday in our mechanics shop before we went trunked
Best offer plus shipping takes it
I can send PIX and a list of the freqs on the rocks
upon request
Thanks Tiny

: However federaly it is not illegal.
: Just remember, Just because FCC says its legal, Doesnt mean it is in
: your home town. Check with your local city hall before you proceed!

Federal trumps state laws with respects to telecommunications.

Besides every state has exempted hams, journalists, and those
who sell and repair police radios. It is usually under the section
of state law that deals with interferrence with a police officer.

And remember, all local communities are charted by their state
governments. Most police officers enforce state laws. Local
ordinances are a small portion of the law. State laws set the
authority of what any city government may do.

>scanners.

NY might want to consider hams in violation, but the FCC
preemption for ham transcievers is absolute (i.e. there is
no caveat that there can be no police frequency
programmed in). Indeed, just how does a police
officer know what any of the "programmed"
frequencies are if someone was stopped with
their transciever in the car? Given the high
probability that some hams with transcievers have
been stopped for traffic violations in NY state without
the police hassling them, I'd say that there is no
problem in NY state....or we'd have heard about it
here before.

Cheers,
Bill K2UNK

Does ANY job come without further training? None that I
know of.

> If they had to train you, then you cannot now claim that passing the
> ham license exam was evidence of electrical skill since those
> organizations did not take that license as proof of electrical skill.
> For those organizations, that license was only proof that you had some
> basic understanding of basic electronics and therefore would be easier
> to train than another person.

Well, well! And today, that can't be assumed, without
further testing. Once a ham radio license conveyed some
minimum level of knowledge and skill, in most cases. Today,
no employer who knows what has happened over the past couple
decades would consider awarding that 'credit' without other
independent confirmation.

> And the ham license of today still serves that purpose.

I'm afraid not. Today's ham license proves only that
licensee was only at least minimally interested in radio,
enough that he completed the licensing process. The FLAWED
licensing process.

However, it
> plays less of a role in the hiring process today simply because radio
> plays less of a role in an electronics career today.

There are fewer two-way radios in use today? What rock you
been hiding under? And there aren't a mass of wireless
services that have sprung up overnight? These are not
"radio"?

Years ago, because
> of the greater role radio played in an electronics career, many more
> organizations were willing to give credit for any radio training (no
> matter how basic). Since radio plays less of a role today, fewer
> organizations give that credit (even those who did years ago).

Your conclusion is true but you erred in your reasoning.
Radio is more widespread than ever, in every area of life.
Even the dreaded HF telephone wireless modems are radio.

> I also think you're being a little disingenuous here, Dick. After
> working at a radio/tv repair shop, graduating near the top of your
> electronics school class, and working in electronics in the military, I
> really doubt that the ham license really played that much of a role in
> your later employment at that "good technical job."

You'd be wrong. And to top it off, they even gave me a
Morse code exam!
The organization had discontinued the use of Morse not long
before, but still retained it as a backup to wireline
teletype. ALL the officials who were involved in the hiring
process were longtime hams themselves, and knew all about
what a ham ticket meant *then*.

> The simple fact, whether you want to admit it or not, is that the ham
> license exam has always been an extrance exam into the world of hobby
> radio (hobby radio, not professional or commercial radio). That is the
> way the FCC designed it many years ago, and that is also why there have
> always been other, much more difficult, license exams for professional
> or commercial radio personnel.

That is neither a simple nor a complicated fact, in fact it
is no fact at all. Just as Novice was the preferred entry
point into ham radio, a ham license was once the preferred
entry point into commercial radio and electronics. The
commercial exams came later (been there too). THAT is what
has changed.

> With that in mind, the existing license exam system serves its > purpose well.

Sure does. It sets the ARS up for making our frequencies
available for reallocation to commercials, since such a
trivialized "service", now easily equated with other trivial
services such as the Citizens Band service, is much less
valuable in its own right. Only ours has VAST SPECTRUM
available for the taking. FCC has just completed the setup
by doing exactly the oppositee of what they said - they have
made the Amateur Radio Service a **NON-technical** entity,
and you have just helped to confirm it all.

I'd imagine the Question Pool Committee will further
confirm it after April 15.

<< However, the Diamond and Icom discones
are probably the best choice for serious monitoring.>>

not only that, RS discones are poorly made (I have one with several broken elements), compared to the Diamond D-130J (which replaced the RS model). The VHF lo whip on the 130 is also a little longer.

No, I never noticed it. Looked and, sure enough, it does say "Space
Shuttle"
BTFOM.

Be nice to find out what that is about.

Do yourself a favor and pass on the Startek. I had all three of the above
and the Opto Cub I have now blows them all away!
http://www.webdeals.net/opto.htm

And the cub is only $149 NEW.

I have heard that NASA has shifted the frequencies of the Suit Radios from 200 mhz up to the 400 mhz band due to interference. Has anyone heard this and if so, do you have an up to date frequency list?

This is what I have now:

296.8 Air To Ground/Orbiter to suit
259.7 Air To Ground/Suit to Orbiter
279.0 Suit to Orbiter/ Suit to Suit

Also - has anyone had any luck monitoring the Suit Radios during passes?

Thanks in advance

Our city has recently installed video/audio systems inside the police cars and I've noticed the officers have wireless microphones on their uniforms.

Is their a certain portion of the band allocated for wireless mic's that police departments use/favor? I had heard in the 170-172 band but not sure.

The alternative is to see a traffic stop and put the scanner in scan mode and see if I can lock onto it.

Also - I would assume that the audio system is made up of several frequencies (channels) to prevent interference.

Anyone have any ideas or experience with this in their city?

Thanks in Advance.

No, but if you've made the effort to learn and understand the theory (and not
to memorise the questions) it's something you can be proud of perhaps.
In VK when you get your license you get both the station license
and a certificate of proficiency. The unrestricted license is the
"Amateur Operator's Certificate of Proficiency" for example. This is
actually quite a nice certificate, with the seal of the ACA etc.

Hi, People!

I'd like to very respectfully and with no malice aforethought <bwg> request that there be some "tailoring" of cross-postings.

I'm over on "rec.radio.shortwave" and there is all sorts of "ham" stuff being cross-posted to it that have nothing to do with SWLing but only with hams.

I think y'all are great and I owe my interest in SWLing to hams but if I wanted to be "in" on ham stuff, I'd subscribe to ham newsgroups.

When I got on the Internet in 1989, this wasn't a big deal as the ng's were so small but - in 2000 - this x-posting really bogs everything down.

As I said: no flame, just a respectful request.

Many thanks,

Gray

If you can't find an NMO mounted antenna, there are NMO to UHF adapters so you could also use a UHF mount. I'm looking over the Diamond catalog and they have to broad band UHF mounted ones.

> FCC GROL)

I posted this a few days ago, but you tried to deny it's existence.
My comments below are relevant to your lies above.

Toilet Boy, you are so easy to bait it's pathetic. I made the
date "error" deliberately to show just how sociopathic and
petty you are, and have been, ever since Bill Cheek kicked
your ignorant butt off Fido net. I knew you would seize on
that point and expose your own moronic brand of stupidity
by doing so.

You've been peeved because Cheek wouldn't let you throw your
inane and childish tantrums in the scanner forum. You've used
that immature anger and pettiness as an excuse to stalk,
harass, malign, and lie about Cheek or anyone else who
denounces you and your behavior for the twit you are.

You've grabbed at any and every minuscule piece of data you
could find and skewed it in order to attack Cheek in a pathetic
attempt to make yourself look better than him. You've compared
your licenses to his, saying yours were superior. You've
inaccurately tried to claim Cheek was technically incompetent

and present yourself as the superior skill holder. You've tried and failed to make your point Toilet Boy because you're just a pathetic loser.

Yet, you failed to play the one ultimate trump card that would supposedly make Cheek look incompetent and you the top dog. You've claimed Cheek didn't have an engineering degree but you did. Yet, you've never been able to prove the existence of yours. After all the angling, sniping, stalking, and forged cancels you never played what could have been your ultimate triumph: show up Cheek and prove the existence of your degree(s).

Is it a case of would not or could not, eh Toilet Boy? I say it's a case of could not because you can't prove what doesn't exist. In other words, Toilet Boy, you're still a pathological liar and a fraud; just a petty sociopath with no life except what exists in your tiny ignorant mind.

1697. [ESL] Euro-Scanner Listserver - Update

Newsgroup: rec.radio.scanner
Date: 2000-01-14 00:00:00 UTC
From: bigbloke@my-deja.com
Message-ID: <85ncbttkv1@nnrp1.deja.com>
Source record: 96429
Cross-posted to: alt.radio.scanner.uk,alt.radio.scanner,rec.radio.scanner

Hi Fellow scanner users.

A number of you may be subscribers to the "Euro-scanner" listserver.
Which recently went off air unexpectedly.

For those of you who have never heard of ESL, it is a subscription based
mailing list dedicated to discussion of radio communication in the VHF/
UHF spectrum and beyond. a little like an email based newsgroup.

I've just received this email from the list Administrator:

Daft rumours are starting to reach me that the list was "Closed Down" by
officialdom. This (as far as I know) is not the case.And as List Admin,
I have not received any orders to close down the list whatsoever.

It would seem that Grid9, who were very kindly hosting ESL have had some
kind of trouble. Either technical or financial trouble it is not yet
clear to me.

Upon noticing the server process was no longer responding to commands I
went to look at Grid9's Homepages at:

http://www.grid9.net

All that was visible was a "document moved here" link which was set up
to point back to itself.

A look at their server status pages :

http://status.grid9.net

showed no outage information since June 98. A check of the site (mirage)
which has been used in the past to relay information on G9 outages
revealled no outage details either.

I tried to contact Grid9 by mail and phone for a few days but was
unsuccessfull.

Fearing the worst, I went to the companies house website at :

http://www.companies-house.co.uk

and looked up grid9's trading status records in the database.

What I saw suggested that although grid9 were still registered as a
company, they were no longer trading.

I rang Companies House for clarification , to check whether or not this was the case, they informed me that it most certainly was.

I mailed all 400+ users of ESL and explained the situation to them.

Immediately after these mails went out, I checked my own inbox .

ARRRGH! in the inbox was a mail from one of the Grid9 Admins saying that there was a problem and that they hoped it would be fixed by Monday (10/1/2k).

I posted a retraction to all users and informed them of the update from G9.

I have been checking the Grid9 servers twice daily since that day and have seen no sign of change.

I also rang companies house again as, if grid9 were still trading after all, it was wrong of them to tell me that they weren't!

After a "Merry dance" around the departments. Companies House were quite adamant that although Grid9 as a company were still in existance, they most <<definitely>> were no longer trading.

So where now ?

Well I'm at a bit of a "Crossroads" right now.

Grid9 have been damned good hosts & good sports over the last few years & I'm reluctant to "split" from them without giving them a chance to resolve whatever issues are keeping them off air. Particularly as I've developed some PERL scripts that take care of 98% of all list administration automatically which would have to be re-written in order to support a different listserver program.

At the same time, I have received several kind offers of alternate facilities (Many thanks Ladies & Gents!) and I'm well aware that 420ish users are missing the service (if my inbox is anything to go by);-)

So what to do ? my plan of action is to wait until next Monday to give Grid9 a full week to resolve their issues, or at least give me an update. If after Monday, the list is still down or I cannot get hold of the sys.admins to clarify, I will reluctantly have to re-host ESL elsewhere in cyberspace.

Due to personal comittments, this may take
a few days to set up so please "Bear with me" in the mean time.

All existing members will be notified directly of the outcome.

Regards to one and all,

ESL LIST ADMINISTRATOR

I Hope this might explain something to some of you!

Regards

BB

You can look in CQ mag (January 2000) for a review of the Alinco DJ-V5 HT. I think there's also a review at this link http://www.strongsignals.net, but i'm not sure.

Around here they are in the 467 band on splinter freqs. Back a few years ago when my mother had bypass surgery I took my Scout up to her room and found the freq. I live 4 or so miles from the hospital but when I got home I pointed my Jbeam that way and was able to hear it. Pretty cool at that distance.

Dick,

I think you're downplaying your own abilities and attaching too
much importance to the license. Sure, the license, especially in
the past, was a 'flag' indicator of certain abilities, but that hasn't
been true for years. I think the status of a HAM license as a
flag of technical competance went out the window in the 60's,
when consumer technology moved away from 'hand wired chassis'
and tube technology. Not that HAMs changed any at that time,
but the public perception of 'high tech'. And over the years it's
further changed.

Mike

1702. VR-500 v. DJ-X10?

Newsgroup: rec.radio.scanner

Hello All,
I have the opportunity to purchase one of these and was wondering if anyone has owned both to compare?? I read Rich Wells review. Hard to make up my mind. I like to monitor CW/SSB and heard that the VR may not have the best audio. Also, seems the X10 eats batteries. :)
Any and all comments appreciated!
Thanks and have a great weekend.

Source record: 96435

Those are the frequencies I have (I was a Shuttle flight controller
until June '99).

NASA was looking at moving up in frequency to avoid RFI during space
station ops. While I was there, we flew a recording spectrum analyzer
to look for quiet frequencies around the world.

One of my unachieved radio goals is to hear shuttle UHF during an EVA.
In theory, it should be easy, but so far I haven't heard 'em.

Incidentally, NASA (like the military, I think) calls 200 MHz "UHF",
but we know better.

Consider the Yaesu VR-500 as the "next generation" DJ-X10T.
The Yaesu has similar functionality in a much smaller, lighter package,
a "real" volume control knob, and runs a lot longer on just 2 AA
batteries.

The VR-500 I tested scans slowly, but it's faster than the DJ-X10T.
My VR-500 could be hampered by intermod on the 800 MHz band
which would be a consideration if you lived in an urban area saturated
with 800 MHz transmitters.

I found the Yaesu somewhat easier to program. It has a more rational
channel/bank naming convention. The DJ-X10T construction is impressive
due, in part, to its metal rear cover. However, the DJ-X10T is
heavy and I took the VR-500 with me more often due to its tiny size
and light weight...perfect for hiding in a shirt pocket.

I like both scanners, but don't see a motivation for buying a new
DJ-X10T
at this point when the easier to carry VR-500 is available.

Watch for my quantitative VR-500 review in the next issue of
Monitoring Times (Feb. 2000).

: > > W5TIT
:
: > I do not question the rules and regs. I simply do not
: >think "Amateur" radio operators help Police agencies
: >because of their "civic duties". I believe it's for the attention.
:
: Since we receive little recognition from our community
: service, evidenced by the fact that most of my
: neighbors/co-workers/friends--indeed myself (before I
: became a ham) are completely unaware that ham radio is "out
: there" during an emergency, the correlation between public
: service and "attention" for said service cannot be made.

Most public service is done by hams for personal satisfaction,
for a sense of giving. We do not receive money or thanks.

: > I however do not have "Blind Faith" in police agencies
: >either.
:
: Oh, believe me, neither do I. But, I don't look at my
: service as much for them as I do for the people in my
: community. I simply use an available mechanism to help my
: neighbors/co-workers/friends. My disdain for the police
: community, in general, is well known to my fellow hams in
: this area.

What people like him do not think about is all the public
service being given by volunteers in all areas of our
communities. Red Cross, Boy Scouts, dealing the old,
the mentally ill and the homeless are just a few.

: > It seems to me (at times) that hams go out of their way
: >to help the people who will screw them the most later. I

: >suppose I do not like doing much for my Govt. as they
: >do very little for me.
:
: It seems, then, that your anger is misdirected toward the
: amateur radio community. As I said above, I do not look at
: my public service as helping the police and "govt."
: agencies as much as I feel I am helping my community.

He sounds like Scrooge. He pays his taxes so it government's
job to care, not his.

: >
: > I do not see the above as grounds for foxhunting illegal
: >transmissions for the police, on police bands.
: >
:
: While an extreme scenario, you may feel differently about
: that jammer disabling police frequencies if the ability of
: the police to save someone's life (maybe your own or
: someone you love's) was impeded by some jerk thinking
: he/she is being funny.

Wait until someone he knews dies because a jammer
blocked help from getting there.

: > And if you started supplying "voluntary noncommercial
: >communication service" to the public on a regular basis,
: >(non-emergency) you would have to pay from someone.
: >
:
: Well, I wouldn't have to pay someone :->. We, by our Rules
: and Regulations, are not allowed to perform that service on
: a regular basis...and it is inferred by those same rules
: that governing agencies are not allowed to request our
: assistance on a regular basis.
:
: I have learned, as a new Newsgroup person, that too much
: time is spent in here degrading and arguing. I don't want
: our exchange to become that. It is obvious to me that you
: are very angry and resentful and, while I understand where
: you are coming from, it is far beyond me to solve whatever
: history it is that has brought you to your current way of
: thinking. I would ask only that you please remember most
: of us commit to public service purely for the benefit of
: our community more than for the benefit of any one agency.
: We also know that our service goes largely unrecognized.
:
: 73, Kim W5TIT

BTW, Mary K., happy 45th this coming Tuesday.

>"""Bud, you're just flat wrong. There's no other way to say it. OWNING the
>equipment is NOT a crime.""
WE are playing with words here. It may not be "illegal" from a "state" or
federal "felony" type definition but The FCC uner their own interpretation of
their own regs "take away" peoples radios all the time without catching them
using it. Ask any trucker who has been to a "weigh stop" where the FCC was
checking for "non type approved" CB radios. Many truckers have had their "240
channel" Galaxy radios taken away at these checkpoints. And remeber, before
you say the "it won't hold up in court" crap, You can't walk to the courthouse
when faced w/ an FCC violation, The judge will tell you they have no
jurisdiction. You can only appeal the "forfiture" to the FCC, the people that
originally "imposed" the monitary or equipment forfiture in the first place!!
I don't agree with it, but that's the way it is........

>well for you but will cost much more than the Radio Shack antenna.

The older version of the Radio Shack discone, i.e. the antennas manufactured prior to 1998, had no vertical element for VHF low band reception. However, the discone which Radio Shack presently sells has a vertical element for frequencies at 50 MHz and below. The addition of the vertical element has made a dramatic improvement in the Rad Shack discone's performance on VHF low band. (I also used one of the old Radio Shack discones with no vertical element, and it was deaf to signals below 50 MHz.) However, the Diamond and Icom discones are probably the best choice for serious monitoring.

This maybe the local ordinance for the area!
However federaly it is not illegal.
Just remember, Just because FCC says its legal, Doesnt mean it is in
your home town. Check with your local city hall before you proceed!

Not any more! All that's required is the determination to
make the necessary memorizations, and to stay with the
program until it's done. At which time no one will be able
to determine, without some sort of additional testing,
whether the newly licensed Extra has learned anything at
all! Now, the only differentiation among the amateur license
classes is merely "Did you memorize 35, 70 or 120 question
and answer pairs?" Neat!

> However, they are entry
> levels to their enhanced privileges. In no sense are they graduation
> certificates, or proof that someone has achieved something great in
> technology development.

You don't say. I guess that's why all the newcomers come to
the old Extra with all their questions and problems- or once
did. Evidently they hadn't learned that he was just a
beginner, too. What drivel.

> Amateur radio never was meant to be a college
> degree.

For most radio technical people over the term of its
history, a college degree just wasn't in the scheme. Nor did
it need to be. Yeah, we know those of you who came along
later would like to change that. And as far as ham radio is
concerned, you got it done.

> The only applicability of an amateur radio license to the
> commercial world that I know of is that an Extra will get you a *Third*
> class NARTE Technician certificate.
>

Well, Hoop de do! That just shows how much disdain you
"engineers" have for any non-engineer. We just don't count.
Fine, I sure don't need your "Narte" nasty and wouldn't have
it. I had a First Phone that the FCC junked, the same way
they just did to the Extra class ham license. Whatever

little technical prestige Extra had remaining, and after 15 years of Question Pools there sure wasn't much, is now gone to the same junkpile. RIP. It was once upon a time a Very Good Thing. Now it's nothing.

From: Bruce or Tracy <bljacobs@hiwaay.net>
Message-ID: <387FDA4C.6494B032@hiwaay.net>
Source record: 96309

AT THE RISK OF BEING FLAMED, a friend of mine that I used to work with had a college buddy who took the microwave unit out of a microwave oven and figured out how to "aim" it. He mounted it in the front of his car grill and when passing a radar trap, he juiced it up and it supposedly messed up the radar gun by flooding it with more waves than it could handle.

After a while, and several guns later, he said that the state troopers noticed that their guns would "mess up" everytime a red car passed by, and by logical thought process, figured out that it was the guy in the red car doing the damage. He paid a hefty fine and spent some time in the local "hotel", courtesy of the local "troopers' union".

Has anyone heard of that happening before? This thread just reminded me of that story. I have no reason to doubt my friend's word, but of course his friend could have been feeding him a bunch of hoowie.

There is a world of difference between 5 wpm and 13/20 wpm.

At 5 wpm you can still get away with thinking about each letter after it
is transmitted. By 13, and quite definitely by 20, you had better be well
integrated with the code, recognizing the "sound" of patterns, or you will
fail quite miserably.

What mags should we watch for? Hopefully they can be converted easy enough as
.5 watt radios on 900 will be pretty usless.

Tom,

I've worked on 100s, 200s, 220s and many other portables over the years. All of them can be a bear to work on if you are not experienced with working on portable equipment. Hey, the first time I worked on a piece of equipment with surface-mount stuff I cussed up blue streak (my language darn near desoldered the parts without the soldering station :)). Now, it is second nature.

I'll totally agree with you that most modern handhelds have poorer RF performance than the 70s vintage radios like the 220, both TX and RX. However, those "bells and whistles" is what sells radios.

Honestly, relax and back up a bit from things and try to acheive a detached
perspective.
This restructuring will do no more harm than the no-code tech. change did.

Things will go on largely unchanged after 4/15/2000. Don't panic.
About the only real change will be that Extra and General licenses won't
mean quite
as much as they used to. Dumb, lazy, or slothful people will still be kept
out by the
5 WPM requirements.

Check out this page for information on state scanner laws:

http://www.afn.org/~afn09444/scanlaws/scanner3.html

According to it, you need a PERMIT to use a scanner in NY... most states only require that a scanner not be used in connection with a felony crime. Read up on your state and any states you frequent to protect yourself from local law enforcement.

You are exactly right.

Typical frequencies are 188.xx MHz. I was wearing one of these transmitters for a week in a hospital recently. Very nice system; gave me a degree of freedom I would not otherwise have had (going to the potty). The system reports if one of the five leads fall off, if battery gets low or similar problems as well as the heart functions.

The TX was a bit bigger than a pack of cigarettes, had 5 leads attached to my carcass, and was carried around my neck in a small cloth pouch. Very well constructed. Apparently a throwaway battery lasting a week or two according to the nurses. I did not see any provision for charging a battery, and did not have the energy to dissect the thing although I gave it a thought.

>Hams are exempted. Our equipment can receive police as well as
>ham frequencies.

Hams are only exempted in certian states, like KY, where possession is illegal for anyone except those that you mentioned (hams, those who sell scanners, etc...). Again, check out http://www.afn.org/~afn09444/scanlaws/scanner3.html

It's a great page that details those states that have laws that somehow limit the use of scanners.

maybe. mine improves reception greatly, especially VHF. they get skip when the sky is clear and after it rains. you should also get a tv antenna amplifier to cut out static and help pull in weaker signals.

Don't see how it will do much. The radars operate above 10 GHz and the oven magnatron(sp?) is at 2.450GHz. High power though...May cook the cop.

1738. What's so big about digital?

Newsgroup: rec.radio.scanner
Date: 2000-01-15 00:00:00 UTC
From: dingdongdicky@aol.com
Message-ID: <20000115013227.26030.00000562@ng-fr1.aol.com>
Source record: 96326

Everyone is talking about how new digital radios will be unreadable by scanners.
What is the difference between digital and regular transmissions? Also, how long will it be before scanners are able to pick up the new digital frequencies?

1739. How do you use the eavesdropper program?

Newsgroup: rec.radio.scanner
Date: 2000-01-15 00:00:00 UTC
From: dingdongdicky@aol.com
Message-ID: <20000115013403.26030.00000563@ng-fr1.aol.com>
Source record: 96327

What does the eavesdropper program do, and what do I need to get it to work?
Please help.

1740. Yagi Antenna Question...

Newsgroup: rec.radio.scanner
Date: 2000-01-15 00:00:00 UTC
From: Andrew Koch <ppc603ev@g3.dynip.com>
Message-ID: <ppc603ev-991660.02001215012000@[24.12.106.199]>
Source record: 96328

I am an avid scanner listener, who has just moved about 25 miles (as the bird flies)... I would, however like to continue listening to my favorite dispatcher (KDB441). The problem is, that particular station does not transmit with too much power. I know this because I can pick up a station that is only 3 miles from KDB441 on the same frequency.

KGE406 (the other station) has their transmitter located in a river valley that runs NE - SW, and I can still receive them. KDB441's transmitter is located on the top of that valley's ridge.

Now, the logical solution would be a half-wave Yagi antenna. however, at the frequency of 33.86Mhz, that makes the antenna about 15 feet high and about 9 feet long. As I live in an apartment, that is not exactly feasible.

I have considered building a 1/4 wave yagi, however I am not to sure what that would do to the gain.

I do not have a SWR meter, so all of my gain measurements are perceptive. (as in, how much better is the reception)

The interesting thing is, where I used to live, I could pick up the dispatcher who is NOW local to me (KSS946) with the SAME Radio Shaft discone antenna that I had at my old place.

One OTHER (little) detail. I CAN (with a lot of static) pick up KDB441 with my little mag-mount CB antenna in my CAR with my PRO-64, if I go north about 2 miles, which take me to the highest point around here, about 250 feet higher than where I am now. BUT, where I am, there are no hills (at least close by) between me and KDB441's transmitter, other than the tops of a few ridges.

My question(s):

Is there anything that I can do to my Discone antenna to increase the gain on 33.86 MHz?

Is the formula that I have for a 3 element yagi antenna correct?
Driven element is a half wave dipole
Increase the length of the driver by 5% for the Reflector element
Decrease the length of the driver by 5% for the Director element
Space the elements .15 wavelengths apart on a boom that is .3 wavelengths long.
in this case (33.86 Mhz)
Driver: 14'
Reflector: 14" 8.4"
Director: 13'

Spacing 4' 2.4"
Boom: 9' 8.3"
and, if I DO build this antenna, I was going to use 1.5" Aluminum pipe for the boom and 3/4" copper pipe for the elements.

Last question...

Why, when I travle about 20 miles down the affore mensioned river valey, can I actually hear KDB441 on my Shinwa MONIPAGE Monitor/Pager??? The valley is NOT straight, and I'm still at the bottom of it, and can still hear the dispatcher.

Andrew

I have the EMoP hand-held Internet scanner radio. I have got the regular scanning to work, I get local police and shortwave, and trunking and stuff, but when I flip on RadzNet1 2 or 3 , with a lot of the internet scanning features, it does not let me hear anything; I am not pulling in all the frequencies from around the country.

I can get Chicago and i guess all the western US from about 50mhz to 1300 mhz and LA and (i think Nevada?), but Atlanta never comes in. I'm sure that's in the list.
I've got the InRad set to port 21344 and I know that I should get overseas, but I seem to get about half the US only.
It's kind of like half the internet is down.

I know I am online for sure, because i get the time sync and the news, so i know my reception is clear (it sounds pretty darn goood).

The screen says "NetRad NetPort sequencing enabled", but on this hand-held the LCD is kind of hard to read and I can't see if there is a check mark next to it or not.

So do i need to change the port for different parts of the country / world.
I think it should be just turn it on and go.
My InterRad ISP says everything is fine cause i'm getting charged for airtime :)

I guess my question is how do i change the port, just so i can see if that makes a difference.
Or is it in the Iport..

Thanks

If you are even getting probation in this case you should kiss the feet of every prosecutor who is even involved in getting you probation in the first place. The only way you would normally get probation in a case of this magnitude would be if you "cooperated" with law enforcement agencies in further drug investigations, or other illegal activities. In Florida, as in most of the other states, possession with the intent to deliver, of this size, would net you 10 to 20 years in state prison, serving at least an actual five years. If the Feds prosecuted the case (using the US Mail) you would get a minimum of 10 years Federal time, at least that is without "cooperation".

What is this, some kind of troll?

Possession of VALIUM? Unless you had a large enough quantity to trigger "intent to distribute", possession of a prescription drug without the proper container and label is only Criminal Possession of a Controlled Substance in the Seventh Degree in New York.

There is no nexus between owning a radio receiver and illegal possession of a controlled substance, unless your activities created one. Were you listening to the cops when they busted you? Do you have a lawyer? Is this story even true?

I bought this model three weeks ago and on half of the channels i can get it to show the pl but my twoway receives it. i know all the pl for the channels as having been in public safety for a number of years.

It happens more when i search through uhf trying to listen for a towing company on a leased repeater and i tried pl and dpl with no luck. It seems like sometimes it doesnt want to pick it up. the other thing i noticied that if you set a pl on a freq it still receives carrier squelch which i dont want i want transmissions filter out by squelch codes. the relms does better at that

if you want to share info reply via email
thanks

The Panasonic 2.4 GHz DOES have "spread spectrum" listed in the
features. The problem is that the spread spectrum is only for
the 2.4 GHz transmissions from the base to the handset and is NOT
for the 900 MHz transmission from the handset to the base,
CONTRARY to representations made by Panasonic.

Once again I am OVERWHELMED by the kind sentiments and compliments offered by my fellow monitoring hobbyists!

ALL of your compliments and feedback are greatly appreciated, and I'm so very pleased that my site continues to appeal to users of all levels as well as remain a source of comprehensive and objective information!

While I do work hard on my site and its content, I also have many other hobbyists to thank who help me to keep up to date with everything that goes on in our multi-faceted hobby! A well-deserved "Thank you!" goes out to all of you who have provided information, links, stories, and other content to the Strong Signals site! I think my site continues to be a favorite because its readers take the time to donate items which they think are helpful which usually means everyone else will as well!

Again, thanks to all of you who have been gracious in your words and your support of my site! Here's hoping we all continue to enjoy it and our great hobby for a long time to come!

Happy monitoring everyone!

Strong Signals,

Hehehe! They said that he was able to get it on a freq. that fried
the radar gun with "over-powered" microwaves coming back at it. Maybe
it just vlew the fuse it the gun - sounded to me like he meant,
however, that it blew the internal guts of the gun itself.

Let's all face the truth, getting your Amature license is the same as getting a drivers license, they got rid of the "manual transmission" AKA "morse code" and as for the learning part, well, they are almost identical. Only the purist of the group study the subject matter to understand how it fits into the scheme of things in the universe and the remaining study what's needed to "pass the test". The former can understand the question and formulate an answer without developing the conditioned reflex associated with giving a monkey a bananna for the correct response, whereas the later only understand the concept of a square peg in a square hole without bothering to understand the rational behind it. There will drivers that know they have to put gas in the tank but do not know where the gas cap is or that there is a hood release!!!!, at the same time there will be licensed amatures that know their radio uses batteries but have no idea what a "NiCad" is! Accept the fact that the "Amature Radio Cult" is being diluted and there will be no more "elite" Amature Radio Group but there will be "groups" of Elite Amatures that use Radios..... nuff said.....

> container and label is only Criminal Possession of a Controlled Substance in
> the Seventh Degree in New York.

I checked his web page and the criminal docket in Florida. If he is the same person, he took possession of 1000 (yes one thousand) vallium from a foreign country through the US Mail. That is definitely "possession with the intent to distribute"! From several other "factors" in the case, it appears he "cooperated", (a.k.a. "RAT"), with law enforcement agencies and got a greatly reduced sentence.

> There is no nexus between owning a radio receiver and illegal possession of
> a controlled substance, unless your activities created one. Were you
> listening to the cops when they busted you?

He had a scanner in his possession when arrested. He also had a "large amount" of radio monitoring equipment in his place of residence when a search warrant was executed there.

> Do you have a lawyer?

Yes he does, according to the Florida criminal dockets.

> Is this
> story even true?

If the initial information he provided is true, then the rest is true. I am a law enforcement officer, I checked the criminal dockets. He should be thanking god and every extremely nice prosecutor involved, (county, state and federal), he is out...but I am sure he has provided some very valuable cooperation.

1754. Re: I Blowed up a Police Radar Gun

twenty posts back they actually called the guy a subhuman....giving credit where credit is due...as for the jamming, the guy could still face charges in federal court since intentional "jamming" is a criminal charge under title 18 USC.....but then again you COULD buy a surplus Radar Gun and aim it at the cops too.......same difference.....incidently the Microwave Unit in question operates at around 2.5 Ghz and would probably only warm up his hands but I'll bet the cops actually caught him because of the long (very Loooong) extension cord he had plugged in since his ignorance of the frequency difference would not warrant enough intelligence on his part to build an inverter to supply power to the unit.....On the other hand the cops more than likely detained him for having a Microwave Oven strapped to the front of the vehicle as the obvious code violation....it was not certified for "5mph crash protection"......enough drivil.......

I heard that there was going to be a new TT to replace the BC-245. Is this true?

Is there a mobile TT out there? Not a handheld but a small mobile. And has it been upgraded like the 235 was? I'd really like one with a detachable faceplate but I'm sure one isn't out there.

I suppose I should have looked at the link. :-)

There are so many trolls and garbage posts in r.r.s. that anything that looks unbelievable is probably untrue. In fact, just before reading the Valium post, I had seen another troll from "Emilio Goldstein" about his "portable Internet scanner." (Any post from that guy is crap. Either he is insane or he just gets his jollies from making up bizarre stuff to post.)

Then there was the garbage about "blowing up" a police radar gun...

Thanks for clarifying the situation, anyway.

Do you really mean display or decode PL/DPL? The PRO-92 will DISPLAY the
tone or code in search, scan, or manual. It will not DECODE the tone in
search or manual. I'll grant you the point that the Relm HS-200 will decode
in manual mode, but if you want to search for a tone or code with the Relm,
you have to do it manually.

That's not what he asked Toilet-Boy. You finally post ontopic and you still get it wrong. Please John-Bowl BIG HAM RADIO operator, answer his question. We all want to know. How much will the signal loss be Toilet-Boy? To what effect will it have on his reception? Waiting for your technical input John-Bowl.

> vf500 did NOT ask how much the loss will be, he asked:
> "would it cause my signal to drop"

You left out "alot" Toilet-Boy. Another friggin lie to cover your lack of knowledge, eh Toliet-boy? He asked if "would it cause my signal to drop alot" John-Bowl. Even a moron like you would know that adding any type of extention is going to cause the signal to drop. If he was adding on a 6 inch length of hardline it would cause the signal to drop Toilet-Boy. He wants to know if it will "drop alot" with RG6. Why can't you answer his question loon?

I ask the Toilet-Boy two questions and all he can come up with is a misquote. That's John-Bowl Mackey. The proof that any ham test can be passed by memorization.

Hey Toilet-Boy, still ducking the issue of proof that you have a grad and inder grad degree. You lack of reading comprehension and technical knowledge says you don't even have that trade school certificate to change bed pans.

>
> The correct answer is: "will cause signal loss due to an impedence
> mismatch"!!! (exactly what I said!!)

Proof Toilet-Boy doesn't have a scanner and knows only how to smoke repeaters and burn up power supplies.

Source record: 96375

Lets assume that the antenna is 50 ohms, it isn't and lets assurm the receive is 50 ohms, which it isn't and the coax is 72 ohms, which it is. The mismatch between the ant and the coax is 1.4 giving a loss of 0.24dB. this happens again when the coax meets the reciever for another 0.24dB. this gives a total of 0.48dB of loss due to using a 72 ohm coax. Beilieve me, the impedance of the antenna will only be between 75 and 35 ohms (1.5:1 VSWR) for about 20% of the scanner's frequency range and much worse at most frequencies. I would say that overall YOU CANNOT TELL THE DIFFERENCE.

Bob

You are absolutely right Bob. This has been discussed on here a number of times. I have been using RG/6 for years on my scanners. Low loss at a great price. Channel Master also agrees seeing they ship RG/6 with their scanner antenna. OTOH, you can just force the issue with the facts and figures as you did and the end result is the same. For long runs RG6 is great, for a 10 run the connectors are probably more loss than the cable. If it were me I would just replace the whole thing with a 60 length of RG6. OTOH, unless you are really into weak signal UHF/VHF DXing it won't matter much will it?

I wish people would quit perpetuating this impedance hysteria on receiving systems. It is foolish. Watching the impedance of a discone on an analyzer is like watching a yo-yo in full action. Its up down and every and everywhere.

Good explanation Bob.

Perhaps we should all check the credentials of both BOB and GLENN.
The last time I looked at the complex impedance charts on a " Smith Chart "
, I didn't come up with those figures.
It is a good thing your not on the technical committee of our repeater
group.
You would probably use that RG6 and splice several pieces together on a 500
foot run.
Any extra signal loss is a compromise to any receiver.
Rick

You certainly are correct about polarization and the losses acquired but
that may be offset by the height and gain of the TV antenna and the usually
poor performance of rubber duck antennas, especially factory supplied units.
If his rubber duck is located on a ground floor or below it certainly could
make a difference. Even if he is above ground level it might help. The best
advise one could give the gentleman is to try it. The efforts involved are
minimal and the results are unknown without knowing more about the users
listening environment.The end results could increase his listening ability.
I certainly hope he informs us of his results if he decides to try it.

It has to get MUCH colder than what you suggest to permanently affect an LCD display. Anyway, when getting cold, an LCD display may not display or work correctly but almost always will return to normal upon being warmed.

Good advice John

Buy yourself an antenna designed for the receiver range you desire.
Anyone who advises the tv antenna is telling you that a 20 db loss is ok.
Plus don't forget that you must then point the antenna in the direction you
would like to monitor or suffer even more apparent loss of the desired
signal.
Rick

You probably paid a couple hundred dollars for the digital camera, I know mine cost me a bunch. I wouldn't think spending another $20 or so on a ac adapter would be a big deal, why risk it?

1813. FS: Motorola Syntor X Low Band Mobile Radio

Newsgroup: rec.radio.scanner
Date: 2000-01-16 00:00:00 UTC
From: Phil Johnston <bombero@swbell.net>
Message-ID: <3882690D.B35EBF79@swbell.net>
Source record: 96161

FOR SALE: Motorola T71VBJ7D04AK Low Band 100W Mobile Radio.

Presently configured as Missouri State Highway Patrol scanning receiver
and 10M & 6M ham radio transceiver.

Unit can be reprogrammed for use between 29-54 Mhz.

Unit has all accessories & is ready to install/use.

Price: $175 (U.S. Postal Service money order).

Delivery: UPS ground (included in purchase price).

This unit is presently configured for dual use as an amateur radio
mobile unit and as a monitor receiver for Missouri State Highway Patrol
channels. It can be reprogrammed by Motorola service facilities for use

on any frequencies in the low band mobile service channel plan. It uses

an EPROM for selecting the frequency, power level, CTCSS, etc.

Excellent condition - suitable for use in any type of vehicle due to
quality and visual appearance.

100 watts RF output.

Motorola "System 90" 8-channel scanning control head with A-B switch for

16 scan lists.

The unit is presently configured for 29.600 FM and 52.525 FM transmit &
receive in the 10 Meter and 6 Meter amateur radio bands.

The receiver is also programmed for Missouri State Highway Patrol
channels which are set up in various scan lists based on districts,
state-wide, etc. These MSHP channels are programmed for receive-only
service and are shown here in their assigned pairs:

42.06/42.22
42.58/42.78
42.38/42.32
42.12/42.32
42.02/42.02
(with PL of 186.2 Hz - selectable as "on" or "off" on all channels).

Additional items included with the radio:
Motorola manual 68P80100W51-A (Syntor X Low Band 31-50 100W)
Motorola manual 68P81060E05-0 (Syntor X High Band 150-174 75W/110 W)
Motorola manual 68P81110E89-B (Syntor X Systems 90S Channel Scan control

head)

Please email me if you are interested.

These digital cameras never come with an adaptor. The only "stealing" going on is by the manufacturers charging $40-50 for the adaptor. It's not like they use some kind of propriatary hybrid ac/dc current. My Olympus camera uses a standard 6V DC Sony walkman adaptor (same polarity and plug size!) On using the switchable kinds, find a voltometer and measure the actual voltage. I have one that when set to 6V puts out around 8V. This is probably beyond the tolerance on a digital camera.

Also - Do you hear very much on the birds or is it either once in a blue moon or 99.9% encrypted?

Understand also there are carrier freq for the crews in the field to tune into -- any idea what the carrier freq are and also the position for each of the birds that can be heard over North America?

Thanks in advance

Body handling: Binary attachment payload not displayed: tayger1.vcf

If you have room, a good used 8 ft. TVRO satellite dish works great. They can be had for removal. YAGI design at those frequencies is pretty complex and will not have any where the gain of a big dish. Designs and equipment are available for conversion from TV to GOEs from several sources.

Joe Walker wrote:

Two handheld whips for sale:

Watson W-881 Super Gainer --16"
Diamond RH77CA --15"

Both are similar, full-range, high-performance antennas for scanning and transmitting. Both barely-ever used. Original price is $35.00 apiece. Will sell for $23.50 apiece including US priority mail shipping.

A bit off-topic, so apologies in advance:

I have collected a variety of AC adapters for my scanners over the years and don't want to buy any more if I can help it. Just bought a digital camera and wondering if I can use my 300mA selectable voltage AC adapter -- with 1.5, 3, 4.5, 6, 7.5, 9 and 12 volt settings.

The digital camera requires 6.5v, 250mA.

If I use the adapter at the 6v or 7v setting, think I'll smoke the camera? Appreciate any thoughts... thanks.

go ahead it will work fine at 7 and probably at 6 also. The current in milliamps is actually going to depend on the resistance in the circuit, 300 is the maximum possible which in this case is fine.

I have the following for sale, Ebay seems to suck these days, so make offer if prices seem wrong.

Heath HW24T (Standard C528) 2M/450 w/ Mars/Cap mod / cell receive, battery, charger and 2 antennas, box, manual, some wear $200

ICOM IC-Q7A - W/Mars/Cap mod done, 30-1300MHz rx (no cell) w/box,manual, antenna, external mag mount antenna & SMA-BNC adapter
$160

Moonlight Products SAFARI Night Vision Monocular (no batteries needed model, HV gen on top, utilizes sqeeze for power, has external IR illuminator, which takes batts, with strap and daylight filter, perfect condition $200

Micronet NET-950 MDT - More info upon request $200

Toshiba Satellite T2115CS 486/75 MHz Color laptop, works fine, bad battery, runs on direct AC,W95 loaded..$250 obo

Photos upon request

Let me know if you have additional information needed

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the | early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 | Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack | PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu | VR-500 are the two smallest "pocket" scanners which | perform. Both are tiny enough to fit comfortably in a | shirt pocket so you can monitor without attracting undue | attention.

Looking for value? At $170 discount price, the 100 channel | Uniden/Bearcat BC278CLT base is a good value and available | at most Sears and Best Buy stores. The Uniden Sportcat | SC200 portable performs very well is an excellent value at | its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, | http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The | Premier (Prime) RD-9 and RD-9SMA are about the same | length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive | cellular phone signals is now considered illegal. By | federal regulation, new scanner models must be designed to | they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service. *

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - | (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, | http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across | the country since 1994, I will locate FCC licensed and | selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and

understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business,

sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.
tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911
tel. 941-936-2397

Monitor Crystal Svc
124 W Walnut St Watseka, IL 60970
tel. 815-432-5296

Short product summaries for over 70 scanner models appear in
a separate article, entitled "Scanner Radio Review Briefs."
For more information about old scanners, see:

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across | the country since 1994, I will locate FCC licensed and | selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished,

including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the

information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in

the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel

Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications
Corp. sells used Plectron receivers, in working condition,
for $75-100. If you require crystals or reeds, TCS may be
able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like"
signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://dune.globe-net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT

Feb 2000 - Yaesu VR-500 portable wide coverage receiver |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very

good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10

temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring

Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by

reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service

Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in

the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very

fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique

frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base

versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked

out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken

around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet

available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are

provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-

channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are

unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit

diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the | country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a | sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Use the 6 volt setting , it is likely to work perfectly good.
A word of caution is to double check the tip polarity.
Rick

Well I would suggest going for hte .5 Volt Under rather the nthe
1.0 Volt over.
IF you observe Polarity, Rembember there is NO standard on which
is Plus and Minus on a lot of Power Adapters I think you can try
it. And since the Battery voltage sags anyhow when using
batteries I doube the .5 Lower voltage will be a problem.

One of my suppliers catalogs shows the new BC780XLT T/T mobile scanner.

Dimensions are: 6.25"W x 1.75"H x 7.5"D.

Date available is shown as April 2000.

Price would be about #220.00 plus shipping.

This kills me..

You spend hundres of dollars for a nice piece of equipment and are tring to get cheap and buy something that may or may not work..and burn up your new toy.

The odds are the 1/2 volt may not hurt you "but" the question is are you willing to play russian roulette with your toys....

Rich

Source record: 96241
Cross-posted to: rec.radio.swap,rec.radio.scanner

Bearcat 220 is a desktop 20 channel scanner with LED readout, covers the usual public service bands plus VHF aircraft and Marine. Good shape, works well, some of the plastic 'chrome' is rubbed off. $50 shipped.

JIL SX100 is a 16 channel desktop with fluorescent readout, usual features with instant weather buttons. In beautiful shape, works well, construction quality is above most others, good intermod rejection. $45 shipped.

JIL SX200 is very similar to the SX100, but has continuous coverage from 25-550mhz (less FM broadcast), and will do AM or FM. In good shape, works well. $50 shipped.

Please reply via e-mail. I'm in North Carolina.

Your question is TOTALLY off-topic for this NG, but anyway-

I would use the 6 volt setting & if everything works fine don't give it a
second thought.
Probably, you would be OK on the 7.5 volt setting also.

Regardless, MAKE SURE THE POLARITY IS CORRECT, as
the voltage would make no difference if the polarity is reversed
& would probably ruin the camera.

Another question: You say you just bought the digital camera. So if
you indeed spent all that money, why didn't you buy the optional
adapter so you would know you have what is correct??

Now you attempt to use damage control by saying your lie was a mistake.
The only mistake you made was not realizing that there was solid proof
available here
on the net to prove you were telling more of your lies!

> OTOH promised to stop when he did.
I never made any such promise. If you still say so, then present the proof
by supplying the post I made which can be verified thru dejanews.

> Now you drunken gap toothed bum, sober up and go away.

Are you looking in a mirror again!!!!

Glenn- You obviously don't know what you are talking about AGAIN!!!

vf500 did NOT ask how much the loss will be, he asked:
"would it cause my signal to drop"

The correct answer is: "will cause signal loss due to an impedence
mismatch"!!! (exactly what I said!!)

I had to work with the top of the range model with the DSP option durring
my vacation work. I must say that I was not impressed. Reception was not
particularly good and the control method of simulaiting a physical radio
on a monitor not as good as it could be.

The digital decoding was the worst part of it all and quite frankly if I
had shelled outy money on it I would be none to happy.

A far better investment is wavecom, although aimed at a different market
and considerably more expensive, but if your not paying...

>anything. Uniden did cover it under warrenty, I never did find out if it
>was due to the cold, or if it was just a defect.
>
There are two things that can happen. The liquid in the LCD is not
especially stable. If it gets cold enough to actually freeze, it is a
little like living tissue,some of the chemical bonds are destroyed in
the process, the resultant expansion may also crack the glass. either
way the display is 'toast'. The temperature where that occurs will
vary according the LCD design, but I'd be surprised if you could make
it happen at temperatures above 0 F.

The more likely problem is that the wire and other bits in in the LCD
have differing thermal characteristics. If some parts in the LCD
expand/contract more rapidly than others, at temperature extremes,
some may mechanically fracture resulting in hard failure.

Before that happens, the material thickens, so it takes longer for the
molecules to align in the electric field, so the display works, but
works very slowly. That will never damage the display.

The "Unloaded" voltage readings from a power cube are mostly
meaningless. On a commercial unit it if it can be set to 6 volts
that would be the "Loaded" voltage.
But small variations, plus or minus .5 volts or so loaded, will
cause no premature failure.

How about neither -- Ham Radio was in trouble until they started lifting the code requirements.

And be careful who you insult (referring to the "no code CB whiners") - after all, they could be at the other end of the conversation on HF, code or not and get you call sign, remember who you are, and conveniently forget to send the QSL...

After all, with talk like that, people might think you have a bad attitude!

In article <85ut3q$dn2$1@bgtnsc01.worldnet.att.net>, mrzog@worldnet.att.net says...
>
>About 10 years ago, I lost the display in my BC200 after I left it in the
>car during a snow storm. The LCD itself went all black and I couldn't see
>anything. Uniden did cover it under warrenty, I never did find out if it
>was due to the cold, or if it was just a defect.

I have an OLD PRO-30 Scanner and use to leave this in the car all the time. Here in Pennsylvania, it gets COLD in the winter. I've had it out in 0 to 10 below weather over night many times. Each time its that cold, the display went partially black, but once it warmed up it was ok. Had that scanner from new (1986) and it still works. However haven't left that one out in the car in years.

Now, my PRO-2035, PRO-60, PRO-26 all have been left out in zero or colder weather and they have never went black. The coldest so far my PRO-94 has been out in has been about 25 and it too hasn't gone black.

1905. MLK Day: Time to honor a known communist symphathizer and adulterer

Newsgroup: rec.radio.scanner
Date: 2000-01-17 00:00:00 UTC
From: rfenforcer@aol.com
Message-ID: <20000117124021.01397.00000952@nso-ch.aol.com>
Source record: 96013

What are you doing to honor "the great" Martin Luther King today?

1) Reading The Communist Manifesto

2) Comparing MLK to other known philanderers like Teddy Kennedy.

3) Wondering aloud why MLK's birthday is a paid national holiday while the birthdays of George Washington and Abraham Lincoln are not.

4) Sending a donation to the Sons of the Confederacy in South Carolina to keep radical black activists from removing the Stars & Bars atop the Statehouse.

5) Wondering why we can have "Black History Month", "Black Pride Week", "Black Spring Break", etc...but not "WHITE History Month", "WHITE Pride Week", or "WHITE Spring Break."

6) all of the above.

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

Does anyone have a list of Airline frequencies San Jose (SJC)?

I already have a list of the ATC frequencies in use there, so I don't need those. I'm primarly interested in the Ramp frequencies used by the Airlines and the various Ground and Gate frequencies that are in used by the Fuel Trucks, Food Handlers, Baggage Handlers and Gate Agents.

I've managed to find the following so far:

129.2000 American Airlines
129.5000 United Airlines
131.7000 Southwest Airlines
460.8250 Sounds like Baggage Handlers, Ogden and Sky Chef

> scanning 800mhz trunked??

Television broadcasts are transmitted with horizontal polarization and trunking stations are designed, typically, to communicate with other mobile stations using vertical polarization. Trying to use your tv antenna will work, but with limited results due to polarization error.

Your tv antenna will work better than the rubber duck for 800 MHz but only if you rotate the tv antenna so it is perpendicular to the surface of the earth. This will reorient the polarization of the antenna to make it agree with the 800 MHz trunked transmissions you are looking for. You will gain directivity but it will, however, cause a degradation in your tv reception.

For more information, see the article I posted about using tv antennas with scanners elsewhere in the newsgroup.

1913. Using TV Antennas With Scanners

Using TV Antennas with Scanners
By Richard Kendrick CET, N7NT
n7nt@primenet.com
Copyright 1998 by Richard Kendrick
All Rights Reserved

OVERVIEW

Finding and obtaining suitable antennas for general scanner use has been a hot topic for a long time. There has been a storm of controversy surrounding television antennas and their suitability for scanner use. This article will show that television antennas can be a suitable and cost effective solution as a general-purpose directional antenna for your scanner station.

Television antennas come in a variety of sizes and designs, with equally wide variety of specifications. This diversity causes confusion for the scanner listener trying to sort all this information and find a suitable antenna to use. The number of elements and what frequency range to buy are probably the two most common questions.

Generally, the more elements on an antenna, the better the performance. If the stations you are trying to hear are more than 25 miles away, the larger antenna arrays would be a good choice.

BASIC DESIGN OF TELEVISION ANTENNAS

Most TV antenna designs are based on the Log Periodic Dipole Array, or LPDA. The LPDA is similar to a Yagi in construction and appearance, with the main difference in the elements and how they are connected. The LPDA has a series of progressively smaller "active" elements placed on a boom where the longest element on one end, and is a half wavelength at the lowest frequency. The shortest element is on the opposite end, and is a half wavelength at the highest frequency of interest. The end of the antenna with the shortest elements are pointed towards the target transmitter.

The chief benefit of the LPDA is the wide frequency range over which it can be operated. Typically, the antenna can be used over a range of frequencies having a ratio of 2:1 or higher. The main electrical characteristics of feed-point impedance, front-to-back ratio, and gain remains more or less constant over this range. This is not true, however, of the Yagi antenna.

For the LPDA to be useful as a TV antenna, it actually needs slightly more bandwidth above and below the standard TV channels. That additional bandwidth, or overlap, can be utilized by the scanner listener to squeeze just a little bit more frequency coverage from the antenna than the designers originally envisioned.

FREQUENCY COVERAGE

The frequency range of the antenna you choose depends on what segments of the frequency spectrum your listening will focus on. Antennas are available that cover the VHF channels only, the UHF channels only, and, of course, the VHF and UHF channels. Many models also include the FM standard broadcast band. For the purpose of this article, it will help to define exactly what is meant by VHF, UHF, and standard FM broadcast bands with respect to frequency.

The frequency assignments for the television broadcast band is not a continuous span. The VHF range is specified as channels 2 through 13. Channels 2 through 6 cover the 54 to 88 MHz range and channels 7 through 13 span 174 to 216 MHz. Sandwiched between channels 6 and 7 is the FM broadcast band covering 88 to 108 MHz. Channels 14 through 83, the UHF range, is 470 to 890 MHz. In recent years, the spectrum covering channels 70 through 83 have been reassigned to the Land Mobile and Cellular Services.

View the TV antenna as a device that covers three separate frequency ranges. Based on the nominal bandwidths of a video signal, the three frequency ranges are 54 to 108 MHz, 174 to 216 MHz, and 470 to 890 MHz. Depending on the antenna, the lowest range covers approximately 50 to 112 MHz, yielding a frequency ratio of 2.24:1. Since the center range has a ratio of 1.24:1; it typically would cover a much wider spectrum. By keeping the 2.24:1 ratio, we could expect a frequency range of approximately 120 to 270 MHz. Design tolerances would fill the gap between 112 and 120 MHz making this range useful, too. The highest range has a frequency ratio of 1.89:1. Keeping with the 2.24:1 ratio would give a useful range of 420 to 940 MHz.

POLARIZATION OF TELEVISION ANTENNAS

The last criteria that must be addressed is the orientation, or polarization of the antenna. TV antennas use horizontal polarization and the type of stations scanner enthusiasts monitor have vertical polarization. Horizontal polarization is where the antenna elements are parallel with the surface of the earth and vertical polarization is where the elements are perpendicular to the Earth's surface. TV antennas are designed for horizontal polarization and might require modification for scanner use.

FEEDING THE TELEVISION ANTENNA

There will be no significant performance loss if you use 75-ohm coax and a TV type 4:1 balun. Just choose a good grade of coax with good ultraviolet resistance. Even though many scanner radios have a

50-ohm antenna input impedance, the nominal SWR (1.5:1) is not a factor for receive only installations. The SWR will vary widely of the intended frequency ranges and will never be optimum. Yes, there is a small amount of loss, but the loss is negligible. You still have the option of using a 6:1 balun and 50-ohm coax also.

MOUNTING AND MODIFICATION OF TELEVISION ANTENNAS

Whether or not the TV antenna needs modified, is based on the type of mast used to mount the antenna. Reorienting the antenna in a vertical fashion puts the mast right in the center of the antenna elements. The presence of the metal mast parallel to the field of the antenna elements would distort the radiation pattern and degrade the overall performance of the antenna. Using a wooden or fiberglass mast solves this problem. If you use wood, some form of weather proofing will be needed in certain parts of the world.

Mounting an antenna with the mast in the field of the elements will require the antenna to be physically modified. Fortunately, the modification is very simple. Most TV antennas use square tubing as the boom. Locate the two mounting holes for the u-bolt clamp and drill two 9/32 inch diameter holes 90 degrees away from the existing holes. Be sure to keep the same center to center spacing so the clamp will pass through the holes comfortably. Depending on the antenna you chose to modify, you might have to move the location of the mounting holes forward or backwards one or two inches to clear an element or the feed system.

If you choose not to modify your antenna, you will need to mount the antenna about a foot from the mast. This will make the mounting more complicated mechanically. Either method will work because neither one is superior to the other. It will depend on what materials you have to work with and your budget.

CONCLUSION

Using a television antenna in a scanner monitoring station offers a reasonable cost to performance trade-off for the scanner listener. You get coverage of the 50 to 270 MHz and 420 to 940 MHz frequency ranges, high gain, good front-to-back performance, and directivity using standard inexpensive TV rotator systems. Obviously, not all antennas available will perform the same in all locations. But for the price and ease of use, the television antenna will provide many happy scanning hours.

We manufacture TV antennas and the other day I hooked my handheld to my test set on the roof. It comprises a UHF and a VHF Yagi coupled with a combiner. I am getting great results from air band right the way up to 800 Mhz.

The LogP design mentioned below will work just fine pssibly with a little lower gain than the above method but with out the need for 2 antennas and a combiner. Here TV antennas cost about $15 to $20, so it would really be a cheap solution.

Have fun.

Joel

Here you go Jim. I have no connection with www.futurescanning.com other than they were nice enough to email this information to me.

Glenn

Discriminator Output From the Icom R-7000 9/9/97

This output is available from R97 on the main IF board. Locate it as follows:

1. With the radio the right way up, the top removed and the front of the radio towards you locate IC6 one inch from the left edge of the main IF board
(closest to you).
2. Half an inch towards you, slightly to the right of IC6 is R97 (10K 1/8th watt)
3. The left side of the resistor is the discriminator output.

However, it is safest to buffer this the signal before bringing it to the outside world. Here is an easy way to do it using "vertical integration" techniques with an op-amp to buffer the signal. It just requires two solder joints to the board and no cuts.

1. Obtain an LM-358 or equivalent dual op-amp (DIP kind).
2. Cut off pin 7.
3. Very carefully bend pins 1,2,3, 5 and 6 so they point directly up. Try to
make the bends just slightly away from the IC body to prevent the pins from breaking off.
4. Bend pins 1 and 2 together and solder them to each other.
5. Bend pins 5 and 6 together and solder them to each other.
6. CAREFULLY locate the LM-358 directly above IC-6, with the same orientation as IC-6 (notches at the same end).
7. CAREFULLY solder pin 4 (ground) on the LM-358 to pin 4 on IC-6
8. CAREFULLY solder pin 8 (+Ve) on the LM-358 to pin 8 on IC-6
9. The LM-358 should now be mounted by pins 4 and 8 above IC-6, with all the
other remaining pins pointing directly up.
10. CAREFULLY solder a 200K 1/8th or 1/4 watt resistor from the end of R97 closest to IC-6 to the LM-358 pin 3
11. CAREFULLY solder the positive end of a 10uF 25V capacitor to the junction of pins 1 and 2 of the LM-358.
12. Run a thin wire from the other side of the capacitor to the center of the spare RCA connector on the back of the radio. Here is the buffered

discriminator output.
13. Put it all back together. Control your Icom radio with RadioMax from
www.futurescanning.com

C'mon. Reception improvement over a rubber duck can be made by attaching a wire to an aluminum ladder. Your TV antenna will give you DRASTICALLY improved results. However, your scanner may be overloaded if located near a strong sinal source such as a pager tower. In this case using the rubber ducky may work better.

Send complaints about Toilet Boy to abuse@home.net.

Toilet Boy the Liar!! wrote:

> If you indeed had this "proof", you would be able to present it.
> Since you can't then your lack of action speaks for itself!

The proof has been provided in the past. Your denials of past evidence
is simple proof of your general stupidity. Since you are inept and
cannot figure out how to access DejaNews, looks like you'll have to
suffer FOOL! You know you're a liar, I know you're a liar, and so does
anyone who stumbles upon your drivel and reads it. This isn't rocket
science Toilet Boy, only lawn mower repair.

> No, you were simply WRONG in your facts & by saying you
> deliberately made the error you are attempting to exercise
> "damage control".

ROTFLMAO!
We had this discussion the last time I baited you. You even tried to use
the same limp excuse. You can piss, moan, whine and deny all you want.
The pint remains: I proved just how petty (again) and extreme you are
when it comes to Cheek or anything related to him.

> I am better than him & my licenses are superior than his. I don't
> have to try to "make myself look better" because I am better!

ROTFLMAO again!
Cheek earned his commercial license before either your or I did. I know
it exists because I asked him to show it to me, and he graciously
consented. A lot more class than you'll ever display FOOL!

> He has repeated proven that himself, the suggestion of a mettalic tuning
> tool in an RF circuit was sufficient!!

Again, you prove how incompetent, inexperienced you are and to what
lengths
you'll go to defame Cheek. What you so conveniently overlook is Cheek
described *one* specific radio and *one* specific radio where he tested
a metallic tuning tool and it had no effect on the adjustment. He did
not
make a blanket statement saying that you could use a metallic tuning
tool
anytime you wanted to. Your continued insistence on this point is proof
that you have no real world experience and are poorly limited to what
you

read in a study guide. Experienced people know from personal first hand experience that many things in the real world work in defiance of what a text book might claim. Inexperienced people, like you Toilet Boy, quote text book dogma like a mantra. It's what separates inexperienced wanna bees
like you from the experienced people like Cheek.

> ANYONE who would know better (myself & almost everyone
> else) would certainly be superior!!

Ah, the voices in your head arguing again. You really should see a doctor
about that Toilet Boy. There have been many recent advances in drug therapy that even can help a pathetic specimen like you.

> I've NEVER claimed to have an engineering degree!!

You've made claims about your supposed degrees for years now and never been able to prove their existence. Yet, you've been proven a liar many times by myself and others over and over again. Why should anyone believe
a known liar like you, eh Toilet Boy? Simply because you say we should? Then you really are stupider than you look.

I've said it before and I'll say it again: you're still a pathological liar and a fraud.

1929. Anyone have one of those old Weather Radio Cubes ?

Looking to buy one of those old Weather Radio cubes sold by
Radio Shack years back.
The one that looked just like a Rubicks Cube with a push button to
listen to the weather forecast and speaker grill on the top.
I know you can buy a new weather radio at RS or other stores(I have
one),but I'd like to have this particular one,have seen them in the
past and always wanted one!

Anyone have one they might want to sell or trade for something?

Thanks

Message-ID: <860ee9$q2o$2@iac5.navix.net>
Source record: 96095

I seem to be picking up what may be a cordless phone at 513.837. I thought cordless's were around 40.XXX (or digital and unlistenable at 900mhz). Since it is illegal to listen to cordless phones I want to make sure I am not listening to any. Could some verify this is a cordless phone freq. and what other numbers at this freq or others not at 40.XXX that one should not listen to so I may faithfully abide by the law.

Thanks

Sponge,

Trying so hard not to break the law it hurts.

You may want to check out the following frequencies:

461.2125
463.2875
464.6375

You should also search ISM band 902 - 928 Mhz range for the portable phone/walkie-talkie like units that several of the employees carry on their belts.

1949. Re: Alinco DJX10T

Newsgroup: rec.radio.scanner

Message-ID: <16524-388400E1-1@storefull-115.iap.bryant.webtv.net>
Source record: 96107

The standard 11 meter CB radio band is in the area of 26.965 mhz thru 27.405 mhz. It is in the HF frequency band, and the mode type is 99% AM & SSB. You might hear some FM transmissions on these frequencies also and this is due to 10 meter all mode radios that have been converted to operate on 11 meters. You can also pick up additional CB transmissions in the Freeband area both directly above and below the standard 40 CB band. 10 Meter Ham Radio is in the area of 28.000 mhz thru 29.700 mhz and can be all modes including CW (Morse Code).

Unless you have a broadband outdoor antenna installed to pick up these HF & Lo-Band VHF frequencies you are not going to hear them unless they are right on top of you. The mudduck stock antenna on your handheld has got the ears of a knat. You are using the internet...get your areas CB homechannel and prepare to zone in to the CAVE-NET !

All kidding aside...get that $39 Radio Shack antenna up on the roof and get ready for the Sun. Hope this helps..so long.

This might solve the ?. I hooked my scanner up to the roof t.v. antenna
and my pro-90 worked like a p.o.s.

Back to the rubber ducky for now!

For those of you that would like to know, I am most of the time in the
basement(or lower level) of my house.

I listen to mostly 800mhz trunked(the coppers)
I listen to the county I am in and rarely have a problem with reception!
The problem I am having is listening to the trunked system in the next
county over. It comes in upstairs as good as my county comes in
downstairs. I am downstairs most of the time thogh so I need something
to bring in the county next door clearer.
any suggestions?
The t.v. antenna is out of the ?

True, a great site...

But now that Rich has acquired a "peripheral" (i.e. a wife), I wonder how the site will fare - especially when the harmonics start appearing !!

Have a look at the photo of his scanner collection - must have over 100 !! Most of them handhelds !!

My wife hit me repeatedly when I showed her - something about "no, no, no, you're NOT buying another one...:-)!

Just about all of the new mobile scanners I have seen will accept a
universal A/C wall wart which can be bought from Radio Shack.

Kurt

No, there is encryption out there. Just check out talkgroup 8088 if
you are interested.

But, the city must not care one tad for the manufacturers warranty if
they have 250 mode MTS2000-III's. According to the motorola
documentation I have, the portables only handle 160 modes...

Coded squelch is an excellent way to reduce, if not completely remove undesired signals. Depending upon your position rewlative to two users on the same frequency it is also a great way to keep those users separated. Obviously if one user is hitting you with a stronger signal, he'll still be able to step on the other user.

And yes, CTCSS and PL are the same thing. PL or Private Line is a trademark of Motorola.

Actually, Radio Shack didn't create the FRS, they revived something
that has existed since 1947. In the old days, the FRS was called
"Class A Citizen's Band". It had kind of gone into a state of non-use
because darn near no one knew it even existed. Have to give Tandy and,
to a lesser extent, Motorola, for reviving it.

It's actually $50... If I can use something that I already own, simple economics suggests that I do that. On the other hand, if it possibly will damage the unit, common sense dictates that I buy the adapter. I thought there might be people here (and there are) who are conversant enough with voltage etc. to help me determine a reasonable course of action.

Hey. Get a clue. Bill left in '98. He's long gone.

He ain't gonna be replying.

Why are you still forgin' around there Mackey? Why do you still rant
and rave about Cheek? What is up with that?

Don't you see how demented you look Mackey?

you friggin' loon.

Toilet Boy the Liar!! wrote:

> I didn't ask you to try to re-direct blame or responsibility, I asked
> YOU to present VERIFIABLE PROOF to support YOUR statements!!!

Since the "redirection" was aimed directly at you, it's patently obvious
that you are attempting to avoid responsibility for your past
statements.
I provided information on how *you* could verify the data. Instead, you
skirt the issue and hide behind your daddy's jock strap. Get a clue,
Toilet Boy. Since you have demonstrated extremely poor short term
memory,
I have repeated my earlier statements for you. As a courtesy, I typed it
real s l o w so you can keep up.

When you were once asked to provide proof of something, you told the
requester to look it up in DejaNews, that "you wouldn't do his work
for him." That's what I'm telling you, if you want the proof so badly,
then you can look it up yourself. I know it's there and you know it's
there. You are just too stupid and in denial to do it yourself. Seek
medical help urgently Toilet Boy, you need it.

Now, Toilet Boy, when you keep skirting around this proof issue, you
must understand that it's a one-way street or a two-way street. If it's
a one-way deal, then that makes you a hypocrite (no surprise there!).
If it's a two-way street, then you should have no heartburn about doing
it yourself. Otherwise, bugger off!

> > You once stated that the FCC cannot verify the existence of *any*
> > commercial licensee. That means your claim, or mine, of
>
> WRONG!!! I never made such a statement!!!

Sure you did. It's your poor memory (evidence of your low intelligence)
that has you forgetting. You must take your medication and that won't
happen, Toilet Boy.

> (Note - the license number is needed to verify the license)

Now you alter your original statements to in a vain attempt to cover
your tracks. In your original post stated that even with the number

the FCC could not verify any license. Check DejaNews. Oh, that's right
you're too stupid to know how to do that.

> > If you have any of the degrees you claim, prove it. Otherwise, it's
>
> I would be more than happy to!! However, out of respect for this NG
> I will only do that after the person you mentioned (old what's-his-name
> near San Diego who has the criminal charges & self imposed cancer)
> answers the desire of the NG and delivers his degree info to the NG for
> verification.

The "newsgroup" has never asked Cheek for his credentials, only you and
your alter egos that manifest themselves in forged posts, and the few
sycophants sniffing your butt. This is just another one of your evasions
to avoid facing the truth; the truth that you are a liar and a fraud. No
one believe you when you claim to have any college education.

>After that happening, I will release all info!!

You've made that statement before and you've never followed through. I
didn't believe you then and I don't believe you now. I'll venture that
no one else believes an iota of the bile that spews from that tosspot
you call a brain either.

If you *really* do have the degrees, put up or shut up. Anything else
from
you is a evasion to hide your lies. Since you can't, that makes you a
liar
and a fraud.

Again common sense about antennas prevails after following the ill advice of
the Cheek-A- Likes!!!
Get some kind of antenna designed for the frequency range you desire outside
with some height.
Cross polarity can really cut down on the signal strength.

Source record: 96050

I think both sides are taking mindless shots here.

First off, getting the signal from outside in is the issue. Will a TV antenna work? You bet, but it may not be what you want.

You'd probably do just as good taking a piece of 75ohm coax and laying it on the roof with an 18" or so length of the center conductor unshielded. Hmm, doesn't that sound like the real cheap bottom line RS scanner antenna? Not that much differnet. You can buy a cheap scanner antenna for $10 or so, but you can make one just as good by taking a socket for whatever the connector you have on your coax and soldering say a 12" or so wire on it so it sticks out straight. Then mount that socket on a small "L" shaped bracket to hold it so the wire sticks straight up in the air. Then put 3 or 4 more wires on the "L" bracket so that they hang down around it in a circle. If you don't know what I mean, just look at the Radio Shack catalog at their bottom line scanner antenna.

If the issue is the wire, and you already have the twinlead, well, you've seen what happens when you hook that up. If you have coax, no matter what the 'impedance', it would probably work. The problem with twinlead is it's such a bad match, you really are effectively hooking up just a long wire. And that means you're not pulling in signals from the roof and getting them down to you, you're pulling in signals from the whole length of wire, right as it goes by the house and all the noisey items there.

But getting the signals from outside (and high up) is your goal. Only problem is, you'll pull in EVERYTHING! This may also include stong local signals that you don't want. Like the cellular mentioned earlier, or a TV station 10 miles away, but at 5 MILLION watts of power and 2000' in the air t be line of sight!

Another thing to consider, 'handheld' scanners are more susceptibe (generally) than base scanners to overload. If you have something nearby, an external antenna way just swamp your front end in the thing. You may not be able to determine what it is, so a trap to take it out may not be practical. In that case you can try attenuators.

So, the original poster said a "TV antenna on the roof". But that can cover a lot of ground. What kind of antenna? What coax/twinlead? Heck, there may even be an old TV amp up there? Anyone think of the ramifications of that? (And before THAT starts a whole new arguement, yes, I HAVE used TV amps for scanner use. They work OK, some of them. But unless you're WAY out in the sticks to need

one, I wouldn't bother.)

Bottom line? If something works, use it. If not, don't. But as to the original TV antenna question, I'd want to know more than was originally asked.

Mike

Source record: 96054

Is this another 'urban legend'? I know a guy who....

The bottom line is it is NOT illegal to own any transmitter in the US.
PERIOD!!!

But, as with all things, there are buts... In the US, POSSESSION of
an AMPLIFIER that is capable of 11M operation with a CB set is
considered PRESUMPTION of illegal activity. It HAS been seized,
but NOT because it is illegal. It is seized for the PRESUMPTION
of ILLEGAL ACTIVITY. And this precedent (scarey as it may be!)
has apparantly been used to seize certain equipment capable of
transmitting just outside of the legal CB band or capable of
transmitting with illegal modes of operation on the CB band.

Again, this equipment has NOT been seized because it is illegal,
and the post to that effect are just plain BS.

One very interesting side note on this. A CBer caught with
equipment that can transmit outside of the CB band could get
in trouble. BUT, if the CBer held a HAM license, and the equipment
was capable of transmitting all the way to legal HAM frequencies,
then the authorities would have a hard time with the presumption
of illegal activity. They would probably have to prove actual illegal
activity.

I wouldn't believe this as the microwave is at 24g where the radar
units operate at 10.245g. Would take a lot of re-tuning to get it
down to 10.2g. Another myth of a lost mind...

Toilet Boy the Liar!! wrote:

> Once again, when asked to provide proof you only say it has already
> been provided. If true, you would have no problem presenting it for
> verification.

When you were once asked to provide proof of something, you told the
requester to look it up in DejaNews, that "you wouldn't do his work
for him." That's what I'm telling you, if you want the proof so badly,
then you can look it up yourself. I know it's there and you know it's
there. You are just too stupid and in denial to do it yourself. Seek
medical help urgently Toilet Boy, you need it.

Now, Toilet Boy, when you keep skirting around this proof issue, you
must understand that it's a one-way street or a two-way street. If it's
a one-way deal, then that makes you a hypocrite (no surprise there!).
If it's a two-way street, then you should have no heartburn about doing
it yourself. Otherwise, bugger off!

> The truth always hurts, so laughter would be good medicene for your pain!

Yes, in your case it does. You have been in denial for so long about the
truth that you are a liar and a fraud, you must be in intense agony.

> Then how come the FCC has NO RECORD of the person you mention
> ever possessing an FCC license as you (& he) claim?

You once stated that the FCC cannot verify the existence of *any*
commercial
licensee. That means your claim, or mine, of holding a General
Radiotelephone
Operator's License cannot be verified, let alone Cheek's, except be
direct
physical examination of the document. Once again, you skew the truth
into
some bogus distortion that attempts to make you look superior to Cheek.

> > You've made claims about your supposed degrees for years now and never
> > have provided proof
>
> WRONG!!! I have NEVER claimed to have an engineering degree.

If you have any of the degrees you claim, prove it. Otherwise, it's a
lie,
just like you Toilet Boy; a liar and a fraud.

> To Reply:

I believe all that antenna is is a 1/4 wave dipole with angled radials,
it should
work better than the telescoping whip that came with the radio but 1/4 wave
antennas have no gain. A better bet would be a cellular antenna that has an
honest 3db gain because of its colinear design.

2012. "Low Batt" prob. w/NEW batt; BC200XLT.

Newsgroup: rec.radio.scanner
Date: 2000-01-18 00:00:00 UTC
From: recradio1111@aol.comjnkblock
Message-ID: <20000118134003.03565.00000006@ng-cd1.aol.com>
Source record: 96065

The problem thus far.
I purchased a BP-200 replacement battery for
my Uniden Bearcat BC200XLT (purchased used)
because the previous battery was completely drained (to
my knowledge) and would "forget" all stored frequencies
(even with the wall wart plugged in full-time) if I turned the unit
off, then back on.

Received the new battery from Uniden. When I first
slid it on and turned on the scanner, no problem. But the
very first time I turned the on/volume switch "off" then back "on"
the "Low Battery" icon started blinking. The very first time.
A brand new battery right out of the box.

Why would there be an absence of problems _until_ I turned the
"on" switch "off", then back "on" (this was the same procedure that
would cause the scanner to lose _all_ stored memories with the
old battery)?

Short of sending this battery to Uniden for repairs (which isn't
cheap), I'm asking for your help. As it is, the scanner will stay
on for approximately 15 minutes at a time--since the low battery
indicator starts flashing from the word go, then will activate the
automatic shut-off protocol.
Is there something this relative electronic neophyte can do
to open it up and solve the problem myself? Is it something to
do with the on/off circuit? (If so, where is _that_, if there
is such a thing, located?)

It should be noted: I made a modification to the BC200XLT (learned
from reading this newsgroup) which raises two questions: did I
accidentally damage a nearby circuit--due to my poor knowledge
of all things electronic? Two, will the mods for fixing the battery
problems with this particular scanner alleviate this problem (if so,
how do I go about learning how to solder a "bridging capacitor"--
I think that's right)?

TIA. P.S. Please post any replies to the newsgroup; I am
trying out this ISP on a trial basis.

From what I can gather, these phones generate an in-band
analog NBFM signal, and *then* spread it using direct-sequence
technology. The un-spread signal apparently leaks out of
the telephone at a fairly high level.

I am trying to warn everyone that Radio Shack is reselling defective items. Fred, the manager at the Conway, AR radio Shack store informed me that when a item came back in and he didn't fell anything was wrong with it he would resell the item. I took a scanner back that was defective and I showed him why. I later found out that Fred, boxed the radio back up and has resold the item. Folks, this is not right. I informed the Corporate Customer Service about this and the representative told me that Radio Shack has been doing that for years, that they see nothing wrong with it. So Radio Shack buyers beware !!! I have no beef with Radio Shack scanners because I have so many of them, but I just wanted a new scanner buyer to beware that they may be purchasing someone's reject.

I have found the proof in an old American Radio Decay League handbook. Let me detail the experiment so that you can follow along. This will require your participation.

Strip off about 2 feet of insulation off each end of a heavy gauge wire. The wire needs to be about eight feet long, but exact length is not critical. Attach one end to your ankle. The two feet should suffice to make a tight knot. Place your aluminum ladder in the middle of a clearing--out on the golf course would be great. Make CERTAIN that there are NO trees around. Proximity to trees could void this experiment.

Climb to the top of the aluminum ladder--but remember that the top is not a step and you should proceed no higher than the last actual rung. Read the warning sticker on the ladder if there are any questions. I would NOT want you to fall before the experiment is over. Hold the wire with your left hand and stretch your left arm high above your head. That's high. Reach skyward. Hold your Radio Shack scanner in your right hand and do the same. Reach! Both arms should now be stretched above your head and you should resemble Superman flying straight up into the clouds. This needs to be done when a severe thunderstorm is impending. This is due to the enhancing effects of electrical flux.

If you don't have wire, string will do. The important thing is that your arms are stretched high into the sky. If you wait long enough in this position from the sky will come the answer that you seek. From the sky will come the salvation that many on this newsgroup seek.

If for some reason I hear from you again and you tell me that the experiment did not work, then I will admit that my post was simple rhetoric and that most recognized it as such. Except you.

Go to Radio Shack. Pretend to be deaf so they won't educate you. Buy the new 2000 edition of Police Call for $13. It will answer your questions and give you all the frequencies for your area, including info on trunking or not...Don't listen to them, RUN, they might tell you it's possible to receive cell phones on a cb radio! They have a rule, they only hire people who HATE radios, keeps them from stealing them.

Scanners that are cell capable that were made prior to the ban are legal
to buy and sell in the U.S.

I am not sure of the exact legality of buying and selling scanners that
were imported after the ban.
Anybody know the answer to that?

Greg

Message-ID: <3883b4b7.6819931@news.mindspring.com>
Source record: 96111

hey guys & gals,
i'm looking for a detailed list for the 806-823.9875, 849-868.9875 and
894-960 range. i found a list at
www.cc.columbia.edu/~luat/cuarc/fcc-bandplan.html which is very
detailed but only up to 469.975. it has general listings for other
bands but thats all. i'm using it as a search guide by blocking off
freq's in lots and using them as search points (lo-hi). and hilighting
the freq's as they are found. this type of list is good for me
because it list all the freq's in steps, w/type beside each step
i.e 469.125 Business
469.150 Business

30.010 US Goverment
30.030 US Goverment. ect.

anyone know of a list like this for the above freq's
i would be grateful
TIA

2044. San Diego Federal Trunked System?

Newsgroup: rec.radio.scanner
Date: 2000-01-18 00:00:00 UTC
From: Mike <mcurtis@pacbell.net>
Message-ID: <8yOg4.2466$Sc2.58134@news1.rdc1.sdca.home.com>
Source record: 96115

OK... So I'm dying to use my new 245XLT on the Federal Trunked System. I got a list of the freqs from (I can't remember your name :)) someone here, but there seems to be one or more missing. I got a list from "Federal Government Frequency Assignments Fifth Edition" as the following -
406.3500
406.7500
407.1500
407.5500
407.9500
408.3500
408.9500
409.1500
409.5500
409.9500

One one the list that I got originally wasn't on this list - 406.9500

406.7500 probably isn't right and it sounds like a weak EDACS control channel (a ship-board system in port?)

In the last day, I've come across the following talkgroups -

8912 - MPs (Miramar?)
8944 - MPs
2000 - Federal FD Dispatch? (E2/E21/M92)
2032 - EMS Dispatch? (M90)
4400 - M90 talking to Navy Medical Center

1392, 2448, 2800, 6032, 9072, 9744, 10064, 18384 - Unknown

Anybody have any information they'd like to share? Thanks!

Mike

Once again, when asked to provide proof you only say it has already been
provided. If true, you would have no problem presenting it for
verification.

> > I am better than him & my licenses are superior than his. I don't
> > have to try to "make myself look better" because I am better!
>
> ROTFLMAO

The truth always hurts, so laughter would be good medicene for your pain!

2059. Re: Will cold temps destroy an LCD Display?

Newsgroup: rec.radio.scanner
Date: 2000-01-18 00:00:00 UTC
From: Dave Holford <holford@sympatico.ca>
Message-ID: <3883DA56.67942153@sympatico.ca>
Source record: 96130

I hope not. We are forecast to hit -30C/-22F tonight and I have two ham rigs and an LCD display auto radio sitting in unheated vehicles in my driveway. I have every expectation that they will work tomorrow.

The worst I have seen is around those temperatures when I would set my Kenwood TR-7950 on scan the display would be very slow changing until the vehicle warmed up, then it would be just fine. The rigs out in the cold are an old TR-7950 and an IC-207.

The only time I have seen weather affect an LCD display was when I had a rig sitting in the sun while I worked outside in mid summer. The display went completely black, but recovered when removed from the sun and allowed to cool down.

I can't document it but it seems I read somewhere a few years back
that current LCD's shouldn't be damaged by the cold as the Mfgrs.
after initially having problems with cold temps and damaged LCD's had
added a sort of anti-freeze compound to the LCD. ??

Hello,

I recently added a PREFIX look-up form on the QSL page. If you need to know where a prefix is from, simply enter the call or prefix and see what country it is assigned to.

You are invited to http://hfradio.org, a non-commercial site offering:

+ Azimuth Map / Equidistant Map Creation (choose any QTH as center, many options)

+ Propagational Resources (live, real-time reports, eAlert service (sign up for automatic email solar/geo reports, complete with Aurora index))

+ News, and DX information and reports

+ QSL Manager and Callsign Lookup center

+ Swap and Shop

+ FREE HOME PAGES THAT YOU CAN USE TO POST YOUR OWN HAM OR SWL SITE

+ Bookstore - SWL and Ham related books. Over a 1000 titles so far.

+ Plus more (Directories, etc.)

73!

Hmm, time to get a 'credit'. But you should know that RS has a "QA" team at the warehouse that routinely opens a palet of an item, and does a QA check on every one. But these will almost never have open things like packs of screws or mics or other accessories (unless that is what is being QA'd) just the main unit. And the QA groups at the warehouses are usually pretty good at opening, checking, and sealing boxes back up without the casual examiner being able to tell.

One interesting note... When I ran a RS back in the 70's, I used to watch the 'order decks' and just routinely put in orders on blank forms for any stock number I didn't know what it was. I'd see a 'hole' in a sequence and fill out a form. Well, I did that, and through a couple of 'mistakes' I ended up with 12 (yep, a DOZEN!!) PRO-2001 scanners before they were announced, before they were on any order deck, before they were even in the computer for pricing. In fact, it turned out BEFORE the QA department had a chance to even approve the shipment! I got their 'test palet'. Oh were they pissed. Oh was security pissed. Oh was I pleased... I put one on display and a friend came into my store and asked what it was. I showed him and he asked if it could get weather. I punched it in and TOTALLY on a freak it pulled in a weather station from ERIE PA! (I was near Lock Haven PA, and never since has that scanner, which my friend still has, ever received Eire, although they have since put in local weather.) He bought it on the spot.

I had other stores clamoring for units, which I promptly forwarded to them, with an 8% handling charge!! I HAD to get some of them out quick, as they KILLED my budget for the month on inventory.

You know, some people loose sight of what they are trying to do.
This morning I had a discussion with a friend on 2M during the
commute that made me think of this.

People sometimes get hung up on the 'correct' way of doing things.
The 'best tool' syndrome, but the 'best tool' isn't always the 'best
tool
for the job'. For example...

We were talking about alternate heat with this cold spell we're in. My
friend has an old 'coal stove' that happens to be sitting on his back
porch. I told him, open a window, feed a chimney through a board
to block the air, and heat if the power fails, just to keep his house
from freezing in the current sub-zero (F) temps. Or he said he could
just rig it up on the porch, which is enclosed now, and open the
sliding doors. Who cares if it's the 'correct' way to do things. Who
cares if he's loosing 99% of the heat. What he cares about is the
heat he can redirect into the house to keep his pipes from freezing!

This is a pretty old topic regarding Radio Shack. Most of us have similar stories to tell, and most everyone who has done business with Radio Shack has suspected this. But after personally witnessing a customer return a Radio Shack product, I watched the clerk and the manager, open and inspect the box and its contents, reseal the box, and put it back on the shelf, with a full retail price.

Since the manager and I had known each other for a while, I asked him about what I had just seen. He said that if he were to send it back he wouldn't get credit for it with Tandy, so he'd have to take a loss, and that it would likely not go to a repair center. It would be looked at, repackaged and in most cases sent back without so much as a bench evaluation. IF they even plugged it in at all. The thinking was, that if the product came back, it was probably because the customer was too picky. So, take it back and resell it to someone who probably doesn't know the difference anyway.
I was appalled. And he could tell. He smiled, and said, "Look, you come in here twice a week and you buy screws, resistors, and whatever plugs you need for the day. Not in the 5 years I've been working here have you ever come in here and bought a piece of equipment. Why? Because you buy better than this. I know it, you know it, and most of my clerks know it. So we don't even try. We're not for YOU. We're for the guy in teh service that wants a walkman, or the Dad who's too busy to shop for his kids for Christmas,...none of them really know how this stuff works, or what it's supposed to work like."

Which raised some interesting questions about the parts I had been buying. So, I did some tests on those resistors, and capacitors, and as a direct result of that conversation, and my bench tests, stopped buying at Radio Shack for anything but the odd screwdriver, or maybe a pair of binding posts.

Yes they can. As long as they are TRUE pre-ban scanners Nothing
in the law prevents parties form selling them.

When I buy anything like a radio or similar from Radio Shack, I tell them up front if it isn't new in an unopened box, I don't want it. A couple of times, all they had was the floor model, i.e., the one sitting opened out on the shelf. When I objected, they always say "it still has the full factory warranty".

I don't care, I don't know what other people have been doing with it or to it!

Direct-sequence is a spreading technology, not a modulation technology.
To be pedantic, it is true that direct-sequence works by modulating
narrow-band signal, but the modulation introduced by direct-sequence
carries no information.

Direct-sequence operates by digitally generating a pseudo-random
digital sequence (also known as pseudo-noise or PN sequence) and
modulating the phase of a narrow-band signal (usually by mixing
in a balanced modulator). The process is exactly reversible by
mixing the spread signal with the synchronized PN sequence.

Certainly, if you have a digital signal, you *can* modulate the
PN sequence with it and then just spread an unmodulated carrier.
When you despread the resulting spread signal, you get an
carrier modulated with the digital signal.

However, there's simply no requirement for the actual modulation
to be digital. You can still have a direct-sequence spreader with
analog modulation.

Does this answer your question?

Have a look at my previous post:
http://www.deja.com/getdoc.xp?AN=572874778.1

An excerpt from this note:

The key was found at http://www.connect-9.com/panaresp-1.htm -
in summary, there's a very credible explanation that the
SST phones use an analog NBFM signal, which is spread using the
Direct-Sequence Spread-Spectrum (DSSS) method.

Scanning is legal in Canada with pretty much the same restrictions as
in the US, however you can purchase full coverage scanners in canada,
and it is up to you to make sure that you don't mistakenly scan private
communications with your capable scanner :-)

>
>Thanks in advance.

If you can stand a dynamic range between 70 to 80 decibels, if you can
stand a noise floor which is substantially higher than typical SW
receivers, and if you aren't planning to use this radio with a large
outdoor antenna, then you should be ok.

In particular, the lower bands such as 75 meters will require an
attenuator so that levels going in to the antenna jack of your radio
don't overload the front end.

If you really want, you could buy the radio, and then build a small
passband filter to listen to just 75 meters. The IMD products should
be lower...

In other words, you are too stupid and lazy to search DajaNews to find
the answer for yourself. See above.

> WRONG!! Many members of this NG have asked many times for the
> credentials of the person you mention above

Only the voices in your head that emerge as forged posts have made such
requests. Ultimately, that is still you, a single piece of flatulence in
the wind.

> That is because he never provided the data as desired by the NG. Once
> again I will say, "After that happening, I will release all info!!"

You're still trying to use that cop out to evade the truth. You can't
provide proof for what doesn't exist. *You* made the claim of having a
degree in the newsgroup and that entitles *anyone* to challenge you to
prove yourself independent of any other person or circumstance,
including
Cheek. You have to protect your lie at all costs and that's why you
continue this fiction.

> out of respect for this NG in will uphold my word as always.

That will be a first. I, and many others have proved you to be a liar
on several occasions. Historically, the 'value' of your word is nil.

I say it again Toilet Boy, you are a liar and a fraud.

Toilet Boy the Liar!! spewing more lies:

> > I rest my case.
>
> Once again, when asked to present proof of your accusations, you avoid
> & turn away.

You're still in denial of your mental impairment, Toilet Boy. Having a
good memory is one of the key elements of intelligence and you
repeatedly demonstrate incredible weak short and long term memory.

As far as offering "proof" of your deranged mental state, I give you
each
and every piece of drivel you post. This is not, as you say, turning
away
from the issue.

What has you so cheesed off is that I won't let you keep throwing your
inane tantrums and I keep spanking you. If you don't like it, take your
medication and behave yourself.

2098. SC200 software support (other than SmartScanner)?

Newsgroup: rec.radio.scanner
Date: 2000-01-19 00:00:00 UTC
From: fjsieder@microimm.mcgill.xae

Source record: 95919
Cross-posted to: rec.radio.scanner,alt.radio.scanner,alt.radio.scanner.uk

Hi,

I was wondering if there is currently anything out there for programming/operating the SC200 through its computer interface? I realize that Uniden provides the smartscanner interface but I have my doubts that it has information on Canadian cities (Montreal). I have heard about the Senss freeware software and WinScan (Pozilla) for the 245XLT and other programs that support the 895. Do you know if any of the programs that support those other scanners are being modified to support the SC200?

Cheers,
Felix

You are absolutely right Mike. Keep in mind that Rick/Mackey has his own agenda and its nothing to do with scanners. On that note, antennas are fun to play with and open to all sorts of experimentation. In this guys case he didn't give any particulars other than he needs to hear 800 MHz, is using a rubber duck and wonders if a TV antenna will work. First thought by anyone really should be is stick that sucker on there and check it out. Why not? I still ROTFLMAO when I think of one newbie asking on the Shortwave NG asking if it would hurt his scanner to hook it to his TV antenna. The guy was a neurotic freak with a drug problem who probably shouldn't be operating anything. Anyway, some people have had some success with TV antennas on scanners in the horizontal, losses and all. It just depends how bad the antenna is you are switching from.

Keep warm.

See other messages about scanner shops. Scanning is legal in Canada, in fact, it's legal to scan cordless and cell phones (they're on the same frequencies as in USA).

For frequencies check:

I think there the *only* two stores in the area, not counting Radio Shack. Actually Durham Radio is just outside Toronto (Whitby). The Canadian Radio Shack only carries a subset of the scanners that the US Radio Shack carries -- and they are cell blocked.

Also, Durham Radio has better prices than Radioworld, but doesn't carry ICOM. However, prices for both (especially Radio World -- the ICOM R8500 is approx. $US 1952, the AOR8200 is approx $US 697, the AOR5000+ is approx. $US 2789) are very high. Also, if you buy it at the store, you'll have to pay an additional 15% tax. Radioworld has a 15% restocking charge for returns and returns must be made within 7 days. (I'm not sure of the return policies of Durham Radio.) Canadians are usually better off ordering from a competitive US dealer (they are allowed to sell unblocked versions to Canadians), even after shipping cost, duty and tax.

See
http://www.radioworld.ca/
http://www.durhamradio.ca/

Yes, me too, they always say they have them in the box, then when you decide to buy it they go in the back of the store and have to talk to someone and finally tell you that is the last one! Happens to me more than 50% of the time on sale items!

In article <38839b13.10149177@news.westol.com>, booger@nose.com wrote:

: Given this, do any of you gentlemen know exactly which type of
: encryption the AT&T 9110 900 Mhz cordless uses?

That information is out there on the web someplace. I remember reading something that would almost certainly cover it a few months ago, but I couldn't tell you where, or what's in it. It wasn't a topic that interested me enough to pursue, so it got shuffled off to the mental trash can.

Having said that, while there's no law (that I'm aware of... I.A.N.A.L.) against tuning up that particular set of frequencies, there IS a law that makes it a crime to *DECRYPT* any encrypted radio transmission, regardless of the source.

Of course, if you play it smart and keep your mouth shut about anything you hear, who's gonna know?

With all the other misspelling aside, it is ETC. <<<etc.>>> (with the period), short for etcetera. NOT ect. That little bit drives me to retort.

Wouldn't even think of translating the Latin, I know your limitations.

Rock on moron.

By the way --- modern liberal folks tend to conveniently forget that the Nazis were the liberal democratic party of 1930s Germany. They got so liberal that they declared themselves the Socialist Party of Germany. It was mostly a youth group, which is why they were adamant left-wingers. And like their modern US counterparts, justified all their bizzare and racial policies in the name of good, the children, and the future generations (just like our Democrats).
The white hooders of the American South were also disgruntled Left Wing Democrats sticking to their party's politics.

True, our history of Democratic Party's Racism is pale compared to their German counterparts of the 30's -- but ours have a lot more resistance then they had.

(this is not an endorsement of the original post, but merely a statement against throwing stupid morons against morons -- it makes such an ugly mess)

And no, they all three do not share the same holiday. President's day is for all U.S. presidents. All of our holidays are held for nobel and abstract causes and not for specific people -- with only 2 exceptions: Jesus Christ and MLK. And we have the radical left trying to eliminate the JC ones as well.

To critize reality, you must first confront it.

How can you tell if it is a "new" one or a "reject". Is there
a way to determine that before I leave the store? Sorta hard
to put the radio through its entire paces in the store.

I'm not sure I get your gist. Every store tries to resell their
returns. In Radio Shack's case, it doesn't really pay to send
defective products out the door like that, since they will only
be returned.

I don't follow. Why would an analog "unspread" signal (narrow FM
of course) be required in the first place? Why not just use
DSS? I still think there is *no* DSS or digital on the 900 MHz
transmissions -- the "analog" transmission is all there is.

Why is the "markup" relevant? If you paid $300 for scanner X
(model A), which had a markup of 30%, would that make you feel
better than if you paid $300 for scanner Y (model A), which had a
markup of 100%?

>Before you buy.

Get a Trunk Tracker. It will do both Trunking Tracking and continuous
frequency scanning, but not at the same time. There is a model that is
comming out or may already be out that will do both at the same time
though. I have a RS Pro-90 and I LOVE it. I wont go back to a standard
scanner.

Fry's Electronics (along the west coast) does the same thing, but to a much larger degree. My biggest recommendation would be to look at the packaging, most people will not package everything back up just like new. So check the fit of the tab on the outer box, many times you can tell if it's been pried open before, then look inside the box at how everything is wrapped up & placed inside the box. This won't always work, but usually I can tell when I'm getting a box that has been opened and one that hasn't. If they give you one that appears to have been opened, ask them to give you a different one.

Not foolproof, but still better than nothing.

Jason Merrick

2125. Re: Using BNC antennas on SMA radios...what type of adapter do I need?

Rat Shak sells a BNC/SMA adapter through the special order
program they call RSU. I think its about $15 plus ship. If you
manage to find an uneducated droid that seems to delight in
offering you long distance or a cell phone, ask him for a copy
of the 2000 catalog. It's on the same page as the new little
2-Meter and 440MHz Ht's they sell and order it by calling
1-800 -THE SHAC(k)

Yep-it's been done before(actually with the old os-456), but it will work
either way...ask at Javiation...he will know for sure.
But NOTE...the 205 is rough to find now-so make sure you can actually get
one before you go any further.

I don't know how 'legal' it is but if someone is going to complain
about it they might as well add Best Buy, Circuit City and Office Max
to the list (and who knows which other companies) as I've
seen/mistakenly purchased items at those stores that were 'returns'
also. One _easy_ way to tell is if you see all the boxes of a certain
item in shrink wrap and one that isn't , it's a good bet the one that
isn't is a return.

I tend to agree with the "inspect your new product" idea. I have had 6 scanners (RS) over the years (I love them) and a scanner or two ago, I opened a box of a nerw scanner I bought "just to look at it" and guess what.....There was a scratch on the display and a couple of small scratches on the case. Why? Your guess is as good as mine. I politely asked for another one.....

Actually, some stores have their own shrink wrap machine/device.
They can re-wrap the box so that you'll never know it has been
opened.

Please clarify your modification. It is possible to really foul up the
radio if you are not careful.
You should allow the new(?) battery to charge overnight first to make
sure it is fully charged.
It shouldn't lose the programed frequences even without the battery
conected. Least for many hours.There is a way to turn off the Low
battery display and keep it from shuting itself down at the usual
battery level.
Feel free to email me. I think I may be able to help or at least clarify
a few things better.

Hi All,

Parts of the Scramble Intelligence Service (SIS) Bulletin at the
Scramble Website have been updated with more expected movements,
deployments, exercises and other events from all around Europe.
Available are:

SIS-bulletin NL BeNeLux & Germany SIS-NL 018
SIS-bulletin CE Continental Europe SIS-CE 016
SIS-bulletin UK United Kingdom & Ireland SIS-UK 020 (updated)

Since December all three SIS-bulletins have an individual direct
link which allows you to surf straight to your favorite bulletin.

SIS-bulletin NL http://www.scramble.nl/sis-nl.htm
SIS-bulletin CE http://www.scramble.nl/sis-ce.htm
SIS-bulletin UK http://www.scramble.nl/sis-uk.htm

For a complete preview on all military aviation events and more,
check out Scramble Magazine or surf to the Scramble Website at:

http://www.scramble.nl/sisbulletin.htm

Happy spotting,

Iwan Bogels

SIS-coordinator
Scramble Magazine

2144. HF Performance in Scanners

Newsgroup: rec.radio.scanner
Date: 2000-01-19 00:00:00 UTC
From: John Coan <jcoan@alumni.duke.edu>
Message-ID: <3885AC4F.E192B972@alumni.duke.edu>
Source record: 95987

No one radio can do all things well. I'm looking at the Yupi 9000 Mk II and one of the features that appeals to me is the coverage of HF.

I am interested mostly and would expect reasonable performance for international broadcasters. Some secondary interest in SSB communications, especially on 75 meter ham band.

So, is the HF coverage just a gimmick or is it actually useful?

Thanks in advance.

>
>
Brings to mind a funny time I had with an early HT-100, their first 10Mtr SSB
unit. I bought one and was diaspointed to find the screw holes for the
monting bracket where not threaded. I took it back pointed out the
"failure", got a refund. Over the next several months the unit would disapear,
only to return. I asked a kid who worked there and he said the manager could
not get it through his head that with out the threaded monting "holes" the
radio could not be used in a "normal" mobile configuration. They sold that
sucker at least 10 times. When they offered it as a "manager's specail" for
about 1/4 of the new proce, I snapped ti back up. A friend is still using
it and it is a nice little radio. But the RatShackstill pulls that crap.
Always check the plastic wrap, they never get it looking like new, and only
accept "un"new items if they offer you a steep discount!

2146. Lookinf for freqs w/ pl tones

Newsgroup: rec.radio.scanner

> i'm looking for a detailed list for the 806-823.9875, 849-868.9875 and
> 894-960 range.

The following is a little dated, particularly with the refarming in the
901-941 MHz range, but it should be useful.

From the FCC Frequency Allocations
on http://www.strongsignals.net/htm/oak_band.htm

806 - 896 MHz: FM @ 25 kHz steps (mobile 806-851, base 851-896)
806.0125- 809.7375 General - conventional
809.7625- 810.9875 General - single channels
811.0125- 815.9875 General - trunked
816.0125- 820.9875 SMR - trunked
821.0125- 823.9875 Public Safety - trunked (12.5 kHz steps)
824.040 - 834.360 Cellular Telephone (30 kHz steps)
834.390 - 835.620 Cellular Telephone (data) (30 kHz steps)
835.650 - 848.970 Cellular Telephone (30 kHz steps)
849.0055- 850.9735 Aircraft Telephone (6 kHz steps - AM)
851.0125- 854.7375 General - conventional
854.7625- 855.9875 General - single channels
856.0125- 860.9875 General - trunked
861.0125- 865.9875 SMR - trunked
866.0125- 868.9875 Public Safety - trunked (12.5 kHz steps)
869.040 - 879.360 Cellular Telephone (30 kHz steps)
879.390 - 880.620 Cellular Telephone (data) (30 kHz steps)
880.650 - 893.970 Cellular Telephone (30 kHz steps)
894.0055- 895.9735 Aircraft Telephone (6 kHz steps - AM)

896 - 1400 MHz:
896.000 - 901.000 SMR/Business/Industry - mobile (12.5 kHz steps)
901.000 - 902.000 Personal Communications Services
902.000 - 928.000 Amateur (33cm) / USGovt radar / various secondary
[915.000] microwave ovens
928.000 - 929.000 Multiple Address Systems (Muzak, et al)
929.000 - 930.000 paging
930.000 - 931.000 Personal Communications Services - base
931.000 - 932.000 (paging)
932.000 - 935.000 US Govt - low-capacity fixed links (FAA)
935.000 - 940.000 SMR/Business/Industry - base (12.5 kHz steps)
940.000 - 941.000 Personal Communications Services - base
941.000 - 944.000 US Govt - low-capacity fixed links (FAA)
944.000 - 952.000 Broadcast Auxiliary - STL (studio-xmiter link)

952.000 - 960.000 Multiple Address Systems (Muzak, et al)

2149. Re: ALERT about Radio Shack

Newsgroup: rec.radio.scanner
Date: 2000-01-19 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <thjh4.97$H4.5290@newsread2.prod.itd.earthlink.net>
Source record: 95992

> So THAT is why they never seem to have the box and sell the item right
off
> the shelf! And did you know they have a 100% markup?

Aww, BS! Radio Shack makes net about 10% or more. People
hear of this incredible markup and go nuts, but they have no idea
what they are talking about. Yeah, there is a 'warehouse cost' that
stores get billed, and it will NEVER be more than 60% of the retail
of an item, but that DOESN'T mean that 40% is profit. That's an
accounting phantom.

Now, some items DO have incredible markup, like individual resistor
packs. But they are generally small items with 'human control' issues,
like counting and managing resistor packs.

A good store manager can make more than 10%. The toad manager
will make less, for a while, till he's moved out of management. (And
don't say promoted!) It's EXTREMELY rare for stores to be
consistantly in the 20% bracket.

As to the original issue that started this thread. If I buy anything at
RS, if it's a 'demo on display', that's PREFERED! I KNOW it works
right! And before the heavy computerization of store sales, I could
USUALLY talk the store manager into extended warrantees. Every
cassette deck I've bought has been a 'demo on display', and I
talked the store manager into ordering a 'spare' R/P head since it
was 'used' and on display. And for turntables, I ALWAYS ask for a
new stylus "in the pack" since the demo is obviously used! That
new HT? Well, the store had better 'throw in' some NiCads for that
demo unit...

If you have a store where there is something not perfect on display,
WHY THE HELL ARE YOU SO STUPID AS TO SHOP THERE??

Mike

There's the admission from Panasonic: "This model uses ... SST similar
to digital technology DSST except it's analog." Hey, if it's not
digital, you can pick it up on your scanner ...

I wonder when they will come out with 5.8 GHz phones.

Panosonic clearly says "GigaRange is indeed a digital spread spectrum
system." Panosonic is wrong -- GigaRange is a direct sequence spread
spectrum system but it is NOT digital. In fact, in another post,
Panasonic admits that GigaRange is SST analog and *not* DSST (digital
spread spectrum technology).

>FCC TO OPEN UP FM AIRWAVES FOR NONCOMMERCIAL STATIONS
<snip>

As much as I hate to agree with them, the NAB has a point. These
stations will be the bane of FM radio. The FCC has learned nothing
from what it perpetrated on the AM broadcast band.

Of course there is one big difference: FM has a capture effect.
However, the picket fencing most listeners will hear as you bounce
from one station's capture to another is going to be extremely
annoying.

I predict still more drive-time crowds migrating to other media.

Of course, for the scanning community, we have a whole new venue of
difficult to receive FM broadcast stations. Whoooeeee!

>Germans?
"Uh huh. That's what I thought. More blatant discrimination against white
>Eurpoeans."
Why the HELL SHOULD we have any federal holidays for Europeans?? Our
holidays should be for AMERICANS, like MLK ect, let the Europeans give their
people holidays, I am an American that was born in America, I speak American,
not "English" (go to any British newsgroup & they'll explain the difference).
MLK was an American, his ideals of Peace & equality have no color. Other
Americans like Washington, Jefferson ect also have ideals that many cherish,
even though some would Rather point out that they were "bad" because they were
known adulters, slave owners, had mistresses etc... Our holidays should not
have a "litmus test" or be based on color or the origin country of the
person's ancestors as you seem unable to get past,
but by the ideals people hold of the person honored. If in the future we have a
"roosevelt day" or a Neil Armstrong" day or a Colin Powell" day I'm not going
to try to figure out what country their ancestors were from or what shade of
skin color they had & complain , BECAUsE they are American & That's all that
matters.....

I guess you mean a computer combined with a GPS.

But then you would have to have two GPS's to get accuracy
within a foot (one only works within a few hundred feet).

But then most hits are trash. You would need a way to enter
what each hit was when dug.

I don't think it has any practical application other than documenting
a very important historical excavation. And those people are still
using pencil and paper to draw pictures of what they dig up.

You seem to be searching for a problem. Here's one. Invent a scanner that
has a database of all FCC frequencies in the USA. Stick a GPS in it and
have it dynamically change the scanner bank contents depending on where
you are at any given time. Create generic channel banks such as; police,
fire,
medical, radio, tv, 2m ham, 73cm ham. Make it do automatic trunk tracking if
needed. Give it a modem link to the internet so it can download update FCC
frequencies easily.

Better yet, put the whole thing into a ham radio. Include offsets and PL
tones
for the ham banks. Make it able to transmit on 2m, 73cm bands. Make it a HT.

>Every Radio Shack product, with the exception of certain things like
>software, has a 30 day money back guarantee. I have returned items
>saying that I simply don't like it, there is no need to make up stories
>about defects, etc...

People should figure this out. Making up a defect doesn't help
anyone. Most stores will take a product back, defective or not. In
some cases, with some manufacturers, the store actually CAN'T take
back a defective product; they HAVE to let the consumer deal with the
manufacturer. For example, Sony Digital Cameras can only be taken
back if they're NOT defective. If a dealer takes back a defective
sony digital camera, he has to pay to have it fixed, or throw it away.
Whereas if a customer contacts sony because his digital camera is
defective, sony will cross-ship a new one.

Panasonic is similar. They won't authorize "dealer repairs", but they
will cover the costs of repairs for defective customer owned goods.

So if you make up a defect, you may be limiting your ability to return
a product. If you don't like the product, just say so. It's better
to be honest.

Here are the most important things to remember, that will make it
easier to return a product:

1. Keep it complete. That means all manuals, cords, papers, and
PACKAGING. All that is essential.

2. Keep it in pristine condition. If you get grime all over it,
and scratches, it's going to be hard to return it.

3. Keep your receipt.

4. Know the company's policy before you buy.

If you do those things, it will be MUCH easier to return product that
doesn't meet your expectations.

By making up defects, or forcing a dealer to take back product that
doesn't meet the above criteria, you accomplish several things:

1. Dealer's profits go down, and someday he won't be there.
2. Dealer's return policies become stricter to protect himself.
3. Prices go up to compensate for customer abuse.
4. Manufacturer's prices go up to compensate for non-defective

returns.
5. Nobody is trusted.

It's a lose lose situation. Be honest, and be responsible.

2175. Re: VR-500 v. DJ-X10?

Newsgroup: rec.radio.scanner
Date: 2000-01-20 00:00:00 UTC
From: Dennis/WR4i <wr4i@mindspring.com>
Message-ID: <3887742A.76D80699@mindspring.com>
Source record: 95768
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi All,
I went with the VR-500...and am very impressed!
The sensitivity and selectivity on the ham bands is impressive! Listened to cw 20/40m and no problems copying/adjacent sig problems,etc.
Now only if it would xmit on all the ham bands. I'd settle for 500mw. :)
Thanks for all the advise, feedback.
73,
Dennis/WR4I

PS Still find it hard to refrain from "xmiting" with this thing when monitoring 2m/440...its so much like a HT!

2176. Re: Why start threads like this?

I have sat back and watched the quality of this news group suffer because of useless, petty and idiotic threads such as this one.

People come here to share information regarding scanning -- not to have this dribble played over and over and over again.

If you have a beef with someone - fine - that is your right - but don't bog down this news group with this crap.

Thank you.

I have them both, and use them both. The below is NOT a review, just things that stick in my mind after a few months of use.

Plusses:

Both: SUPER wide coverage in one package
Alinco: More audio
Yaesu: Volume knob; works fast and not prone to get bumped.
Yaesu: Squelch knob easy to use, stays in position.
Yaesu: Better battery replacement (2 X AA) and life.
Yaesu: Pocket size -- almost shirt pocket size.
Alinco: More rugged feel.
Alinco: Band scan while receiving
Alinco: Functional PRIORITY channel
Yaesu: 10 sets of dual frequency memories. Convenient!
Yaesu: Very easy to use auto-search, auto-write.

Minuses:

Alinco: Sensitivity adv. to 2 gHz but drops dramatically above 1.3 GHz.
Yaesu: Small size
Alinco: Volume control slow; starts off high if last used high (embarrassing).
Alinco: Squelch digital adjustment hard to see, slow; can be pushed by accident.
Alinco: High current drain from batteries; takes NiMH or 4X AA.
Both: Falls over easily.
Both: 15 kHz filter in AM, SSB and CW modes
Yaesu: Band scan mutes receiver
Alinco: Bank linking does not work well with mode scan.
Yaesu: No PRIORITY while scanning
Both: Plastic case sides around on radio

FWIW, I also use my older AOR 8000; it is a much better "Scanner" than these two and IMO beats them on SW performance too. But it's bigger and more fragile. Heck, my RS PRO60 is a better _scanner_; both the Yaesu and Alinco scan too slowly. For scanning convenience, the old Yupiteru 7100 has some nice touches that these newer sets don't have.

One nice touch and near miss: The Yaesu will let you search memories by alpha tag; why not SCAN by tag? Another: Why not be able to scan the dual-frequency memories on the Yaesu?

Silver/Teflon connectors are the best compromise. Silver is a good
conductor and the Teflon insulator won't melt while soldering.

The only regular use of CW on scanner frequencies is for repeater IDs. Most repeaters ID about every 10 minutes to half hour. The code is usually faster than 5wpm however. Just have him download a Morse code program. I origianlly studied from the Radio Shack tapes and when I went in to take my test the code was computer generated. It threw me off quite a bit because the sound was so raspy compared to the tapes.

I'm looking to lengthen the cable to my antenna. I have lots of BNC cabling around, both arcnet (90 Ohm) and Ethernet (50 Ohm)... Which is best to use for my antenna, and will there be much of a loss in quality? (As opposed to using 75 Ohm tv/antenna cable).

Thx,
Dan.

I've been thinking about what they could come up with next, and I have an idea. How about the VR500, that will transmit on HF in all those modes? They already have VHF HT's that receive in wideband, now they need QRP transmission on HF as well. What a nifty little rig that would be!

I rather doubt this, since this would violate the law in all 50 states of the US.

If you are sold something defective by a retailer, you have the right to take it back.

Thought that this might be of interest here:

Dad,

I got this from a friend at work whose brother is a firefighter in Indiana.

It makes you think.

"I Wish You Could See"

I wish you could see the sadness of a business man as his livelihood goes up in flames, or that family returning home, only to find their house and belongings damaged or lost for good.

I wish you could know what it is like too search a burning bedroom for trapped children, flames rolling above your head, your palms and knees burning as you crawl, the floor sagging under your weight as the kitchen below you burns.

I wish you could comprehend a wife's horror at 3a.m. as I check her husband of 40 years for a pulse and find none. I start CPR anyway, hoping to bring him back, knowing intuitively it is too late. But wanting his wife and family to know everything possible was done too try too save his life.

I wish you knew the unique smell of burning insulation, the taste of soot-filled mucus, the feeling of intense heat through your turnout gear, the sound of flames crackling, the eeriness of being able to see absolutely nothing in dense smoke-sensations that I've become too familiar with.

I wish you could understand how it feels to go to work in the morning after having spent most of the night, hot and soaking wet at a multiple alarm fire.

I wish you could read my mind as I respond to a building fire, "Is this a false alarm or a working fire? How is the building constructed? What hazards await me? Is anyone trapped?" Or to an EMS call, "What is wrong with the patient? Is it minor or life threatening? Is the caller really in distress or is he waiting for us with a 2x4 or a gun?"

I wish you could be in the emergency room as a doctor pronounces dead the beautiful five-year old girl that I have been trying to save during the past 25 minutes, who will never go on her first date or say the words, "I love you Mommy" again.

I wish you could know the frustration I feel in the cab of the engine or my personal vehicle, the driver with his foot pressing down hard on the pedal, my arm tugging again and again at the air horn chain, as you fail to yield the right-of-way at an intersection or in traffic. When you need us however, your first comment upon our arrival will be "It took you forever to get here!"

I wish you could know my thoughts as I help extricate a girl of teenage years from the remains of her automobile. "What if this was my sister, my girlfriend or a friend? What were her parents reaction going to be when they opened the door to find a police officer with hat in hand?"

I wish you could know how it feels to walk in the back door and greet my parents and family, not having the heart to tell them that I nearly did not come back from the last call.

I wish you could feel the hurt as people verbally and sometimes physically, abuse us or belittle what I do, or as they express their attitudes of "It will never happen to me."

I wish you could realize the physical, emotional and mental drain or missed meals, lost sleep and forgone social activities, in addition to all the tragedy my eyes have seen.

I wish you could know the brotherhood and self-satisfaction of helping save a life or preserving someone's property, or being able to be there in time of crisis, or creating order from total chaos.

I wish you could understand what it feels like to have a little boy tugging at your arm and asking, "Is Mommy okay?" Not even being able to look in his eyes without tears from your own and not knowing what to say. Or to have to hold back a long time friend who watches his buddy having rescue breathing done on him as they take him away in the ambulance. You know all along he did not have his seat belt on. A sensation that I have become too familiar with.

Unless you have lived with this kind of life, you will never truly understand or appreciate who I am, we are, or what our job really means to us...

I wish you could though.

I struggled for quite a while trying to get Smartscanner software
to work with SC200. Thanks to a tip on www.strongsignals.net
message board, I solved the problem. I thought it was worth
mentioning the solution here so others can avoid the problem.

The problem was Smartscanner errored saying it couldn't
open the RS232 connection and the scanner errored with
Modem Error.

Turns out the Palm Pilot HotSync application keeps the
COM port open. Once I shut HotSync down, everything worked great!

The swr will not change any with a good adapter. Also there will not be any noticeable loss. Some of the RAdio Shack connectors have been known to be very lossy at UHF. They sometimes use poor quality construction. There are good quality connectors for about 3 to 5 dollars from other places.

Here's is a way to inform the consumer coming in that something from them may be defective. If the item has a battery compartment place a small note to let them know you had previously purchased and returned the item that was defective. It may get pass the counter then again they may find it.

Hello,

I used to work for Radio Shack and that is all to common at all of there
Stores. Most of the managers of Radio Shack story only order a few
pieces of larger items. I cant remember how many times a customer
wanted a larger item and we only had the floor model. As for the
original thread about repacking returned stuff, yup been there done
that. It was normal practice if someone brought something back, we
would test it, and then if it worked we would stick it back in the box.

I only worked for RS for a year, but I know I would nvr work for them
again and I only go in to look most of the time, but very rarely do I
buy stuff from them since most of the time I can find the same stuff for
less else where.

True, but radio shack is SO stupid about it. I picked up a car power
cable a month ago. Grabbed it quick and payed and got out. Got it home
tried it and it didn't work. Continuity tested it, the fuse was blown.
Looked at the package and noticed the clear bubble on the carboard
back was STAPLED on! They re-packed this cord, fuse blown and resold
it. Someone not smart enough to know how to check (I.E. the previous
owner for instance) would think it's broke and return it. These
dipshits at RS do not have the brains enough to check the cord out to
see WHY it doesn't work, they just staple the thing and put it back on
the rack. If you buy at RS, CHECK YOUR PURCHASE BEFORE YOU LEAVE,
HECK, even BEFORE you pay for it. You ARE more likely to get screwed
by them than anyone IMHO.

Sort of. I see that Panasonic says its GIGArange phones have SST
(Spread Spectrum Technology), although most dealers advertize
these phones under DSS (*Digital* Spread Spectrum -- this is
different than DSSS, which is direct sequence spread spectrum).
Clearly, the GIGArange phones do NOT have DSS.

i dont normally go to radio smack but do suspect them of re-selling. my friend bought her husband a pro-91 trunk tracker after xmas. she showed it to me and i immediately suspected it was used. the box was worn,the beltclip was missing and the scanner window had a slight scratch. her husband was in the room with us and i wasnt able to ask her if the scanner was sold to her as being used. today he told me it wasnt receiving any comms. he brought it to me and sure enough, it was not picking up anything! he was enroute to radio smack for replacement/repair. lets see what happens.

What you were hearing was the mobil units in the clear and the base station using DES Encryption...It sounds just like white noise, and when they unkey you will hear sort of a short high frequency beep. There is a limitation to DES. If you miss the preamble you miss the whole think. So if you signal is noisy. You lose the whole conversation. But that is why they have local area reapeater to use DES Encryption on. But you Tax doller hard at work they get these great systems. And don't use them for a fraction of thier potential,and go spend even more money on buying NEXTEL phones and air time. Which they carry most of thier traffic on.
Cool Huh.

GOVERNMENT! LESS IS MORE!

I have a similar problem with my BC100XLT, I haven't figured it out yet, but seems to be a problem in the circuitry on the board in the back of the radio. I noticed this when I left the radio on for a while, with the battery fully charged. After a short time I picked up the radio, and noticed the back side of it in the center was very warm, the low battery indicator was flashing, and the audio quality was very poor. Tried it again using an earphone plugged in the ear jack, and it seemed ok. Possible problem with the internal speaker or audio circuit ?????

Source record: 95818

The only way to blow up a radar gun is;
take high power radar emission and feed it back to the emitter. Which
will burn out the emitter and it won't work.

I am looking for old, working, receivers. I am especially interested in those able to tune the HF spectrum, but others are good too. I am also interested in the old crystal type with the red led's that indicated which channel it was scanning...

Anyway, if you've got any old equipment like this and are interested in getting rid of it, please email me at ajcogswell@hotmail.com. Thanks.

I am buying old RCA 18" DIRECT TV DSS systems that you no longer use. I will purchase access cards by
themselves, receivers with access cards or complete systems. Please email me with the receiver brand or
model and which type of access card it has. If you are unsure, let me know the number above the bar code
on back. I'll be able to determine what type it is from this information and can make you a prompt
offer.

Thanks,

Mark

Thanks for the research and the informative link. I missed the follow up post (thread tracker down). It is a bit difficult to fathom the technical details, but it's obvious conversations on Panasonic Gigarange phones may not be immune from scanning. Will try to set up some real world "experiments".

Below is a reply from Panasonic CS and an email inquiry on wether the phones can be scanned. Sorry, there is no more light shed here, but it is interesting that Panasonic did not respond to or acknowledge the scanning question.

Subject: FW: KX-TG200-B and Gigarange Tech Questions; call security of 900 mh

Dear Customer, Thank you for your inquiry on the KXTG200. This model uses spread spectrum technology for both the 2.4 GHz and 900 MHz frequencies. SST similar to digital technology DSST except it's analog. Currently there is not a separate battery charger available. If you need further assitance, please contact our Panasonic Customer Call Center at (800) 211 - PANA. <snip original>

Sent: Friday, December 24, 1999
To: Panasonic Consumer Products
Subject: KX-TG200-B and Gigarange Tech Questions; call security of 900mh

Hi, I own this phone and am doing research for a newsgroup on the current Panasonic Gigarange phones as well. There has been some confusion over wether both sides of the call are scannible, (can be overheard with a scanner). Three questions: 1 Does kx-tg2200-b use spread spectrum technlogy for both the 2.4 GHz and 900 MHz frequencies like the newer models? 2. Is SST a similar digital technology like DSS digital spread spectrum that cannot be scanned with conventional scanners? 3. Can I purchase a battery charger for my spare NiMH battery for the above phone? <snip original>

While you are collecting, try to track down one of the WWV based
"Time Cubes". Same size and look much like the weather ones, but recieved
WWV on 5, 10 and 15MHZ. I lost mine(as in misplaced) and it was
usefull after a summer T-storm for resetting the clocks.
Good luck!

>for the ends of my coax cable?

"Best" is a loaded question.
For most radio applications it really does not matter.
Almost all comercial RF fittings/connectors are good.
Exterior connectors should be protected by some of the weather "proofing" tapes.
the biggest differences are in ease of installation.
The better "Crimp" connectors are much easier,
if you have the righ tools, to install over the solder type.
If you are on the ocean coast or on a boat, then slat water is very rough on connectors (and electronics in general) and either gold or stainless are best.
Good luck.

Better brush up on your reading comprehension skills. The "airlines" does not
constitute a paid, federal holiday.

St. Patrick's Day, Columbus Day, and Oktoberfest are not and never have been
paid, federal holidays. In other words, holidays which are recognized and
sanctioned by the United States government.

FCC TO OPEN UP FM AIRWAVES FOR NONCOMMERCIAL STATIONS

The NEW YORK TIMES is reporting in a front page story for Thursday cycles that the Federal Communications Commission will "adopt licensing rules that will permit the addition of noncommercial stations with broadcasting ranges of as much as seven miles."

TIMES scribe Steven Labaton writes that religious, educational and community groups will be able to create inexpensive radio stations on the FM dial with a range of 7 miles.

William Kennard, the chairman of the FCC, explains the move to Labaton:

"This will bring many new voices to the airwaves that have not had an outlet for expression, and it happens at a time when the radio business has consolidated in very dramatic fashion.

I've been struck by the outpouring of interest on this issue as I've talked to people around the country. From cops and clergy and community groups of all kinds. Local governments, Indian tribes and a whole range of subcultures, such as the Creole community in Florida, zydeco fans in New Orleans, and others who would love to have an outlet."

The FCC's bold move, which has been in the works for a year, has been fought every step of the way by major broadcasters led by the National Association of Broadcasters which argues that such "micro stations" will create interference and static for the big boys on the block.

Argues NAB spokesman Dennis Wharton:

"In our view this comes down to one issue: interference. If tens of thousands of people cannot hear their hometown radio station, it's hard to understand how this benefits the public.

The FCC has come up with a way to confound the law of physics. We've documented in an unassailable case that this will result in additional interference on already crowded airways."

An FCC study for the top three national markets, L.A., New York and Chicago showed that such 100-watt stations -- which would have a 7 mile range -- could not work due to the crowded dial.

Instead, those markets will likely get 10-watt stations that can cover a 2 to 4 mile range.

Supporters of the FCC's move included Bonnie Raitt, the Indigo Girls, the U.S. Catholic Conference and the United Church of Christ.

The paper reports that the most expensive aspect of a high powered FM station is the antenna tower. In the case of 10 to 100 watt stations, one is not needed, making a radio station as affordable as $1000 to start up.

Let the future begin.

2247. Frequuencies?

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Can anyone point me to the best online source for up-to-date frequencies in general and specifically Connecticut?

Thanks..

..Joe

You've got 30 days to return it. However, checking out items up front
may save you time later.

2252. Mobile and desktop Scanner question/PLEASE Help

Newsgroup: rec.radio.scanner
Date: 2000-01-20 00:00:00 UTC
From: Radio Rat <Sorry@TooMuchSpam.Com>
Message-ID: <868p6l05ua@enews3.newsguy.com>
Source record: 95845

I need a recommendation on a Mobile scanner for a vehicle and am open to all suggestions. Our requirements are it must receive between 116-400 Mhz AM and must be small. Price is not really a consideration and so far have only found one model from AOR that is even capable of this.

Also need a desktop scanner that has a large frequency range. Trunk receive capability does not matter because our trunking system is digital. Also would like to have an audio out (Recorder) jack if posible.

Any recommendations would be GREATLY appreciated. Quality and capabilities are the biggest issues here. Ease of use is important, cost is not.

Thanks

Not true at all Liam. Here in Mass, for example, stores can explicitly
say no returns. As long as the policy is posted, tough cookies.

You do have some recourse for 'missing' components' but not
necessarily a return. ESPECIALLY now around 'blizard' times
some stores have signs all over the place that there are absolutely
no returns allowed on generators. Manufacturers warranty service
ONLY!

In MASS, as long as stores have a clearly posted return policy,
they can get away with almost anything.

>
>Thx,
>Dan.

You should use 50 Ohm .

Use RG213/U or high quality RG8/U coaxial cable.
RG213/U, e.g., Belden type 8267, has a non-contaminating
jacket and will last longer. Each has an outer diameter of
about 13/32". Similarly sized Belden 9913 cable and clones
have lower attenuation but are difficult to bend, require
special connectors, and can accumulate moisture inside
because they are hollow.

If you must use a small diameter cable for long runs, use
RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high
frequencies. RG8/X (1/4" OD) is suitable for short patch
cords.

2274. FS AOR AR7000B DSP Receiver

Newsgroup: rec.radio.scanner
Date: 2000-01-21 00:00:00 UTC
From: bah@gowebway.com
Message-ID: <86aa50$e7r$1@nnrp1.deja.com>
Source record: 95703
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

For sale:
Brand New AOR AR7000B wide range DSP receiver. This was given to me as a Christmas gift, and it is simply more radio than I need. It is in absolutely brand-new mint condition with all manuals, box, etc.

It has the following features:
100kHz to 2 GHz receive (except cell) in all modes
Step size fully configurable in any size from 10 Hz to 1 MHz
Digital Signal Processing, triple conversion
Remote Control
Color LCD video display
A full description can be found at http://www.aorusa.com/ar7000.html

This is really a neat radio. It has video and audio jacks to allow you to connect it directly to a television. You can see the entire colorful display on the TV and get the audio through your home theater or stereo. Coupled with the remote control, this makes for a very easy-to-use system.

I will ship the receiver UPS ground for $975.

I'm located in Maryland. Please email bruce.henoch@comsat.com if interested.

Sent via Deja.com http://www.deja.com/
Before you buy.

2276. Need help spec'ing new scanner

Newsgroup: rec.radio.scanner
Date: 2000-01-21 00:00:00 UTC
From: Steve Marcus <nospamreply@nospam.com>
Message-ID: <86a946$p4v$1@nntp9.atl.mindspring.net>
Source record: 95705

Hello guys,

I've learned so much from reading this newsgroup and now I ask you all for your opinion on my next scanner purchase.

First some background and my application:

I work in aviation so I enjoy listening to aviation freqs (118.0 -135.0 mhz) and want to retransmit freqs from the local airport in my area onto the net because noone in our area has done it yet. :)

I have been using a handheld Uniden BC200XLT receiver for years. I have a Diamond DJ130 http://www.rfparts.com/diamond/d130.html which blows away my recent purchase of a Grove beam antenna. I got the Grove beam antenna because I thought it would greatly improve my reception of signals that are transmitted skyward about 35 miles away from my home. I know aviation transmitters transmit skyward so I know that antenna height is important. I have my DJ130 at the top of my attic just touching the roofline. I live on a hill so we have good elevation but I am still unable to bring in freqs clearly that are transmitted about 35 miles away from me. I can hear ok but there is some static that I would like to eliminate. I would say I am hearing at about 40% capacity, enough to hear and understand what is going on but still too much static and its making me crazy!

I got a Grove preamp and that helped significantly but I still am only receiving the desired freq at about 40% clarity.

So now I am thinking that this little handheld Uniden which was manufactured in the late 80's might not be powerful enough to tune this freq clearly. I want to know what you experts think. If you think a beefier receiver would solve (or significantly improve) my problem, please reply to the newsgroup. And if you can provide manufacturer's name (and website is you know it), and model #, that is also appreciated!

Thanks for all of your help and I look forward to your educated responses!

Best Regards,
Steve Marcus

>What did the FCC perpetrate on the AM Broadcast Band?

When was the last time you listened to the AM broadcast band at night?
What became of the "clear channel" concept?
Why do we have so many stations on the air at night who can barely
transmit more than a mile with the power they're licensed to use?
Why do so many channels have so many stations under them that all you
hear is a roar of stations?

And you have to ask what they perpetrated on the AM radio band?

>> Of course there is one big difference: FM has a capture effect.
>> However, the picket fencing most listeners will hear as you bounce

>
>I can agree, but won't these new noncommercial station still have to
>get frequency coordinated, and abide by interference rules?

Frequency coordinated with what? The bands are quite saturated in
most metropolitan areas, thank-you very much. Where is the real LPFM
demand? Metropolitan areas. How is this going to work?

>> I predict still more drive-time crowds migrating to other media.
>>
>> Of course, for the scanning community, we have a whole new venue of
>> difficult to receive FM broadcast stations. Whoooeeee!
>
>I love using my scanner as a second FM portable radio.

And I love to use my YB-400 for FM DX. It's quite surprising what I can hear with that little radio. However, this isn't something most listeners are interested in.

FM radio started as a "high-fidelity" sort of market commodity and then as time went on, and the compression wars began, things started to sound worse and worse. These days, the audio often gets compressed so badly that stereo effects often disappear. Now we're adding radio stations with overlapping coverage to the mix, and basically we're going to doom this band to become a total wasteland, just like AM at night.

Whether or not you think the FCC made a bad decision to open up the
FM band to low power stations really depends on where you live.

Out here in the West, it will be a blessing to have something other than
the mindless Top-40 garbage that is on every other freq slot on the dial.

I suppose in the high-density areas of the country, it will be a problem.

This idea isn't anything new, the FCC allowed micro-stations back in
the late 60's but bowed to pressure from the big $ broadcasters and
changed the rules. It's still the big $ guys who whine the loudest.

I guess like anything else, it won't be possible please everyone.

As far as I'm concerned, if we can get some alternative programming
it will be a lot better than the vast majority of the idiotic Country,
Rock
and Rap horse shit we now have.

Yeah I still miss the old days when clear channel stations were really
CLEAR. I could hear WSM in Nashville here in Utah and people
in Nashville could hear KSL.

2287. NiMH batteries

Newsgroup: rec.radio.scanner
Date: 2000-01-21 00:00:00 UTC
From: Brian Willan <bwillan@sympatico.ca.nospam>
Message-ID: <q5hh8sgiul6sg1a6ri721ev5v169507g4c@4ax.com>
Source record: 95716

Greetings

I was at the local camera shop and noticed that Energizer has a line of rechargeable NiMH batteries called ACCU something or other. The AA batteries are rated at 1.5 V 1200 mAh. I immediately thought that they would be great for use in my scanner (Trident TR-4000). The price at the store was $40 CDN for a dual mode charger for NiMH and NiCd batteries which would charge AA, AAA and 9V batteries and 2 AA batteries. Additional AA batteries were $15.00 CDN for a 2 pack. I thought that this was decent price. The package said these could be recharged 1000 times.

I was at Walmart and noticed they had Kodak NiMH batteries and a charger. I could get the charger and 4 1.2V 1650 mAh batteries for $72.00 CDN. I though this might be a little expensive. The package said that these could be recharged 500 times.

When I got home I checked the NiCd's I had in my scanner and noted that they were GP batteries rated at 1.2 V 600 mAh. These batteries get by for use in the scanner, but usually only last 1/2 the day when I am at the race track.

The question I have is whether or not anyone has had any experience with the Energizer or Kodak NiMH batteries mentioned above. Why is there such a difference in the number of times these batteries could be charged? Does that have to do with the operation of the charger? Fast charge versus slow charge? I would also like to hear about alternative NiMH battery brands and recommended chargers. My scanner takes 4 AA batteries.

Please email your responses as I do not frequent this group very often.

Cheers

Brian Willan

Send complaints about Toilet Boy to abuse@home.net.

Send complaints about Richard Kendrick <n7nt@primenet.com> to both:
abuse@primenet.com and abuse@globalcenter.net.

Toilet Boy the Liar!! sniveled:

> I'm not "cheesed" about anything.

Then why do you rant and rave about the most inane things? Actually, you are *quite* peeved about things because you are the one who is trying to flood the newsgroups with lies and no one will let you. You never denied it when I said your lies have been proven many times by others and by me as well.

> I simply won't allow you to flood the NG with your lies

You mean the truth about your lies, forged cancels, fake identities, and stalking of others on the Internet who won't let you act like the idiot you are?

> that has you angry!!

You obviously have are delusional if you think that. You are mildly amusing at best.

What you are cheesed about is that people, like myself, won't let you spread your distortions. You claim Cheek never had a commercial license because the FCC is unable or unwilling to confirm it for you to your satisfaction.

I made you jump through the hoops about the "error" in the issuance of your amateur radio license to show just how obsessed you are with microscopic details of no relevance. You've exercised that same obsession in your pursuit of Cheek.

Cheek told you that he had a First Class Radiotelephone License with Radar Endorsement that was issued in 1966. You acknowledged that when you quoted Cheek's statement in your post on July 30, 1998. On August 3, 1998 you stated that the FCC database only goes back as far as 1984.

What you don't know is that Cheek let his license expire in 1981 and he never renewed it. In those days, the licenses were issued for five year intervals.

I know the license is real because I held it in my hand and read it. If you don't believe me, I don't care. This is as close as you're going

to get to any kind of answer on this issue so get over it and get a life.

Give Cheek's current prognosis, this is the best you are going to get, so take it or leave it. If you won't let it go, it's proof of your obsession with him and your intention to continue stalking him, even in death.

I am about to acquire a 6ft satellite dish. I have an ICOM R8500 which gives me up to 2GHz receive and I would like to play with some satellite software, etc. I should be able to at least get weather satellite feeds. This is not a serious project. Just something new to explore and experiment with.

I have a few questions I would like to throw out before I embark on this expedition:

1. Anyone had any experience with doing this?

2. Will a small dipole at the dish's focal point work as an antenna?

3. What sort of considerations should I take concerning feed lines? Use RG6 or something like 9913? I believe losses will be quite high at upper frequencies.

4. What other signals should I be able to receive without down converters?

5. What could I expect if I did use a down converter?

Well, here is my story about Probe.

I ran Probe 4 for a couple of years, and I have yet to see a Windows program with the power , flexibility, and sheer scanning speed of the Probe series. You can tell, from the outset , that great pains were taken during the writing of the program to make it "just right". One gets the impression, right off, that a lot of "midnight oil" had been burned during its creation. For straight (non - trunking) scanning, it cannot be beat, period.
Probe 5 is another worthy version of this first - rate program, and is well worth the money, considering the many features added to it. I can personally state that I have enjoyed Probe 4 and 5 for years, and never regretted one cent I spent on them (I have gotten my money back about 1000 times) !
Check out what a scanner with 999 memory banks of 999 channels each would cost you, that will scan at better than 65 channels per second on my old 486 "radio control" computer, that has DTMF functions, and that can "lock onto" any agency you please and stay there just as soon as they transmit, with a pre-determined delay time, that has tone squelch, regular squelch, etc,etc,etc,etc,etc, and I am sure you will see the value of Probe quite easily.

2293. Any Canadians who have ordered from Javiation--how much duty to expect?

Newsgroup: rec.radio.scanner
Date: 2000-01-21 00:00:00 UTC
From: fjsieder@microimm.mcgill.xae
Message-ID: <3888e7e5.1746152013@news.mcgill.ca>
Source record: 95722
Cross-posted to: rec.radio.scanner,alt.radio.scanner,alt.radio.scanner.uk

Hi,

I'm considering ordering a radio from Javiation. I have heard that when important items from the states you can expect to pay GST and PST. I assume that when importing from Britain they will charge duty as well. Has any Canadian done this recently and can you give me an idea of what sort of duty rates to expect?

Thanks,
Felix

p.s. If you want to reply via e-mail please change the .xae to .ca

I recall that Grove sells, or used to sell, a book about listening to
"private" signals via satellite. The book described the hook-up, with a
scanner hanging off the whole sat receivers. Perhaps a Web search will turn
something up?

Black Liberation Radio Won.
Today if you listen to the news the FCC has approve a plan that will allow thousands of low power radio station to take to the air. These stations are surpose to improve things for communities that up to this point had no voice. Napoleon Williams is look upon as a pioneer in the micro radio movement. Black Liberation Radio was one of the first station in this country to say to the government of this country you don't own the Air waves and I have a God given right to get information to my community. It was people like Napoleon Williams that forced the FCC to change it's stance on Low Power Broadcasting. They would rather forget this, they would like to act like out of the kindness of their hearts they are giving the airwaves back to the people.
Napoleon Williams and Black Liberation Radio showed them that they didn't have a choice. Napoleon Williams is the Rosa Parks of radio. All the news stations should be looking to interview him. Black people should be singing praises to him. Today we should be proud of the story of Black Liberation Radio a micro watt radio station that forced the government of this country to give in. But like all of our fighters we want recognize what Napoleon Williams did until it's to late. This man should be news today, but instead we will let him be just another forgotten hero. Napoleon Williams, wherever you are for all you've done and for all your suffering my brother I Thank you and when others wake up they will thank you and your family too. WE MUST BREAK THE BLACKOUT ON HIS STORY!

What's the difference between women at ages of 8, 18 , 28, 38 and 48???
The answer is :
08 - You take her to bed and tell her a story
18 - You tell her a story and take her to bed
28 - You don't need to tell her any story and take her to bed
38 - She tells you a story and takes you to bed
48 - You tell her a story to avoid going to bed

You should see the ham newsgroups... then compare them with non radio
newsgroups (i.e. other hobbies and see the calm, polite way many of them
are conducted... WITHOUT CENSORS).

People can't express an opinion on a radio newsgroup without some piss
ant telling them they're a loser or some other creative cliche.

I'm not going to try to hid behind the various email servers about this battle. You all are like a bunch of old women talking about this and I'm growing sick and tired of seeing all of this BS on the subject. Give it a rest. Why does it matter so much? Bury the hatchet for Christ's sake. I could care less about what Cheek did or what Mackey did. WHY DOES IT MATTER?????? Can the present change the past or the past change the present??? Please lay off this stupid subject......This is how I feel about your on going battle about this BS.....Just stick to the scanner stuff.....That's what I like to read. If any of you idiots that are constantly pushing this have a problem with how I feel, please let me know.

Thank you.....

This is the bunk some dealers spew. The dealer has the
responsibility of ensuring the product sold to you is fit for the
purpose for which it was sold. In the case where the dealer
sells you a defective product, it is his responsibility to deal
with the manufacturer not yours. However, if the product became
defective after being sold to you, then your recourse is with the
one (in this case, the manufacturer) who warrants the product.
Unfortunately, getting the dealer to own up to his responsibility
may require legal action. The best thing to do is to avoid
dealers who are known to shirk their responsibility.

I have an 895 that I connected to my PC. I ran a few of the commercial programs and some of the shareware. I can't seem to get the CTCSS tone to log to these programs.

What I want to do is be able to load the scanner with freqs. and have the computer log the freq and PL tone to a log. Then use this to go back and enter the PL plus add the to a D'base.

Thanks for any and all help

Jim

Watch & carefully R E A D, Blake. "There was no listing of him by
name, which went back about 10 years (since the GROL became lifetime)",
Thus, the result was that the FCC was unable to look him up by name, SO
no LICENSE for old-what's-his-name near San Diego could be found. Are
you still having difficulting understanding, Blake?

Joe,
Try percon.You can search for current frequences for any US city or county.
Start at the link below. The search is a few clicks within it.
I've found it to be very useful.
Good luck>

2342. RS 2052 Trunk Question?

Newsgroup: rec.radio.scanner
Date: 2000-01-21 00:00:00 UTC
From: mirage <mirage@eclipse.net>
Message-ID: <388850e8@news.eclipse.net>
Source record: 95877
Cross-posted to:
alabama.birmingham.radio.amateur,phl.scanner,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.scanner,rec.radio.swap

I purchased a RS 2052 and am unable to get it to work
on the UHF Motorola system here in NJ.
I entered all the freqs as instructed including the data channel.
I push the trunk button select the bank and hit the search button.
They say that is to find the data channel. from there it just blinks search
and
thats it. I looked at the programming of a radio from the system and it is
type II/IIi is this the problem. It says it only does type II.
Any help would be appreciated before I bring it back.
Doug

Won't be possible with the SC200. It only supports download. No
upload, and no computer control options. Uniden only provided the
SmartScanner interface which is a one-way only ticket!

I have seen some FAX on both the 2Mtr and 70cM ham bands. There is no
technical reason why WX fax could not be sent on the mrine VHF freqs
but I have never heard of it being done. And, other than some fairly
rare police fax (I do not know if it is even still in use) I have not seen any
"comercial" VHF/UHF fax.
And lastly let's not forget that there are some very interesting WEFAXs from
the weather satellites in the 136-137MHz range.

Pro 2036 for sale. Same radio as Uniden Bearcat 890XLT. 200 channel base scanner that covers all the standard bands plus the military air band. Some of the features are autosort, autostore and weather alert. This radio also has the CTCSS tone board installed.

Radio has a date code of 10A5- October 1995. Includes AC adapter, manual, and whip antenna. The radio is in excellent shape.

$125 includes shipping Priority Mail or UPS ground.

Thanks,

D. Schopp

No problem. I will gladly post the information including name of the
facility, name of the person responsible for hiring, and a copy of
your application. (Now, that was extremely funny) I can even include
phone numbers.

All you have to do for me to post it, is to post the information that
YOU have been asked for in the newsgroups for years now. You first
Johnny.

Insofar as your comment about being hired by any two way shop, this is
obviously another lie, as I have proof otherwise. They did not even
offer you a job as a custodian!

> Or are you lying again like the time you were making harassing prank phone
> calls to my elderly father at his work & the caller ID traced it to YOUR

>

This again Johnny? I hung up on his/your voicemail. I bet just about
everyone in here has made a phone call before, and hung up when they
got voicemail. Even you Johnny. And I never tried to say my teenage
son
did it. Quit your lies Johnny. You were asked for proof of your
supposed
complaint to the SO, and were never able to prove it. You lie again.

Come on John. A TV antenna, located on the roof, will give drastic
improvement over a duck antenna, located in the basement, which is
the situation the person was asking about. Even you can see that,
as can most everyone else, with the exception of yourself and your
alter ego.

In fact, a TV antenna will give excellent results as a scanner
antenna, espically if you turn the durn thing on its side.

While most of us understand your lack of real world experience
with scanners and radio in general, you might want to consider
doing a little experimenting with antennas in general.

It should be noticed, that Bill Cheek has not posted anything to John in
over a year. There is an occassional forge with Bills name on it, but
it is obvious that it is a forge, and just someone trying to make
trouble.

John continues the garbage, but of course will try to act like he is
innocent, by not using the name Bill Cheek, but will say something inane
like "old whats his name down by San Diego that has cancer and no
insurance"

It is a silly game, and yes, John does need to "bury the hatchet" and
walk on.

2352. Re: Ham freqs on scanner

Source record: 95887

Just a couple of quick notes.

There is CW used in the 50mhz and 144mhz band (and some other UHF-SHF frequecies). HOWEVER, most vhf/uhf scanners are not equipped to receive CW. At least not true CW (Emission type A1A). And while many repeaters, ham as well as public service, ID with code in the form of an audio tone over FM (F3E), this isn't good practice material.

One exception is that in many larger ham communities, usually one ham radio club conducts code practice over a local 2m or 220mhz repeater on a weekly basis. We have one in Atlanta, I think on Monday nights. You might check with the local ham clubs in your area.

NOW HERE's THE BIG CAVEAT. This spring the FCC rules will change and all that's required is 5WPM even for the Extra license! This doesn't require a lot of practice because once you learn the individual letter/numbers then you've pretty much got 5wpm.

I'm curious why you ask this; manufacturing costs go up
as the frequency of operation is increased, and I suspect
the performance of a telephone would not be improved
significantly.

Watch out for rechargeable alkalines!
I charged four inside a small transceiver for 24 hours at 50 mA, thinking that nothing bad could happen. Wrong... They leaked and the acid corroded the battery contacts enough to break them.
Actually, I did not follow the manufacture's recommendations, so I am at fault.
I did check an alkaline charger, and found that it charged at 160 mA, however, it is smart enough to shut off.

Nice post Mike! Good Luck!

Being an Amateur for over 10-years, and having attained my license
before the advent of no-code, and still enjoying all aspects of
CB radio, I"M ON YOUR SIDE!

Keep working hard and ask yourself WHY amateurs who HATE CB come
here. They are not superior operators because of the license
they hold. They are inferior humans by trying to talk down to the
next guy based on their inadaquacies.

Dino...K6RIX

I have a Radio Shack Pro-2022 available. 200 channels, including
full 800 mhz coverage. Works fine, includes base antenna and
programming instructions. Asking $200 including shipping.

I am in the market for a new handheld scanner. I live in a metropolitan area so I am looking for something capable of tone (DPL,CTCSS) so I can filter out the "garbage". although 800 mhz would be nice it is not a necessity.

Can anyone make a suggestions on what to look into (or not) based on experience? I want to stay in the $200-$250 price range.

Thanks in advance,

John O'

Read any decent radio book. The higher the frequency, the greater the attenuation. The reason that UHF and microwaves sometimes work better in urban environments is because they "bounce" better than longer wavelengths and can pass through smaller openings than longer wavelengths. It has nothing to do with going "through" more. My guess is that under most circumstances, all things being equal, you'll get more range with 900 MHz than with 2.4 GHz or higher frequencies.

>> >I believe the FCC
>> >has set aside this range for Spread Spectrum.

You're still wrong, the way you phrased it. 902-928, for example, is also an amateur band, and SS is NOT required there at all. So those bands are not "set aside" for any one particular modulation scheme. Certain forms of SS are allowed there, and in the case of some Part 15 devices, SS _may_ be required, although the rules you quoted do not specifically state that; they only limit the types of SS and power levels, etc.

Other factors come into play here, to, such as lower power and wider
separation between transmit and receive frequencies. With enough
separation, duplexing becomes almost trivial.

It's impossible to say. I think it would depend on the state and the
agency, but I think generally they tend more towards the latter.

From: Charley Harp <charp@htonline.com>
Message-ID: <s8kb67oqeh638@corp.supernews.com>
Source record: 95623

Hi, Tinker,

The antenna design you are referring to, I believe, is the sleeve dipole. I've made and used several of these, including my favorite motel room travelling-roll-up-scanner-antenna. Sorry, I can't give you a URL reference, but here's the theory.

Pick a representative frequency among all the frequencies you wish to monitor. The basic design has one quarter wavelength of exposed center conductor as one half of a halfwave dipole, and a quarterwave sleeve of intact braid, pulled back along the outside of the cable, as the other half of the dipole. You can calculate the length of a quarter wavelength by dividing 2800 inches by the frequency in MHz.

In profile it looks roughly like this:

```
------------------
)
-----------------------------
|
--------------------------------------------------
|
-----------------------------
)
------------------
```

Frequency differences of plus-or-minus 10% wouldn't make much difference, but if you are expecting to monitor multiple bands, you may have to make some compromises. For example, suppose you are interested in monitoring at 50 MHz, at 150 MHz and at 450 MHz. A quarter wavelength for each of these would be approximately 57", 19" and 6-1/2". No single antenna length will work equally well on all three frequencies, but the longest (cut for the lowest frequency) would have the best overall performance. But if 114" total length too much, you might consider the very popular 38" overall length, using 150 MHz as your representative frequency. That length will work on all three frequencies, but will be a compromise on the lower frequency.

Construction tips: You will need to remove more than one quarterwave outer jacket to expose enough braid to form a quarterwave sleeve. The braid becomes shorter as you make it expand around the ourside of the cable. Depending on the cable this might require 50% extra braid length. Start with lots of cable and strip the outer jacket back 1-1/2 times the quarterwave (say, 30" in the 150 MHz example). Snip off the extra center conducter later, and remove the insulating material from the center conductor. Sliding the braid back over the cable is easy if you first get a grip around it at the point nearest the cut. Secure the end of the loose braid with a wrap of electrical tape. The whole assembly can be slipped inside 1/2" ID PVC, but you may choose a larger size for rigidity.

Happy homebrewing!

DOES ANYONE HAVE THE MANUAL FOR THE "PRO 2046"SCANNER
ON THEIR COMPUTER. JUST BOUGHT THE SCANNER SECOND HAND
AND ONLY KNOW THE BASIC STUFF.

PLEASE E-MAIL ME AT ... ve3kfq@home.com

THANKS
.... DOUG 73's

2390. Re: looking for a pro2040 manual...Here it is!

Volunteer Examiners, which replaced the FCC in the 80's. You can e-mail
me if you want to ask more question. :)

You have been out of it a while. Don't recall the year but it has been around 10 years ago this started. A VE is a Volunteer Examiner. The FCC stopped giving test and let the hams do it. You need to go to the arrl.org site and see what they have to say. It takes a group of atleast 3 hams that are VEs to give a test.

Unless you are an Extra class check out the new rules that will take effect April 15

You can hardly blame the batteries when you misused them by charging
them improperly against the warnings printed on their label. You
would get an explosion by charging LiIon's the wrong way, and you can
perminantly ruin NiMH's by charging them improperly. For that matter,
if you put a CD on a record player the diamond needle will scratch the
CD's surface.

2398. Re: MOD for PCR1000 w/ 4000 plus Serial

Subject: [PCR-1000] PCR1000 unblock succeeded.
Message-ID: <20000101012821.9293.qmail@hotmail.com>

Here is your Y2K gift fellow hackers:

As all of you know PCR1000's after serial number 4000 can not be modified
whether with hardware or software... well, WRONG...

After countless hours of dedicated work and research, me, Dr.Evil has
figured out how. Here is how:

1. Remove the ICOM chip (MAIN CPU). To do this you either need a SMD soldering
station, or soldering wick and very good hands.
2. When you look at the icom on the chip, on the bottom right side, there
2 pads for a 0K resistor, solder a piece of very thin
wire there. (0K resistor does not fit under the chip)
3. Remount the chip.
4. You are good to go.

This operation requires very very good hands and the proper equipment. I've
done mine with a SMD soldering station, but it is doable with a good
soldering iron and good hands.

I do accept no responsibility if your receiver gets broken.
I do accept no responsibility about the usage of your unblocked PCR.

Happy F*cking New Year!

Kaiser Soser

PS: I am working on a DSP based decoder scheme for receiving mobitex. Will release that as soon as it works.

Not splitting hairs. Correcting poorly phrased (mis)information. With a topic as complex as RF, antenna theory, and propagation, it behooves one to be as clear as possible, particularly when posting in a relatively unsophisticated group like r.r.s.

I don't pretend to be any sort of expert, so when I post something, I generally include some sort of disclaimer or reference.

You just contradicted yourself. In your message to me, you claim that you meant that "through more" meant going through smaller openings. Now you claim it meant going through dense material, which just does not happen, generally speaking.

Just a little story to demonstrate how this works. One day I was driving in an urban location, listening to a high-powered AM broadcast station, which transmits down in the area of .5-1.6 MHz. I was also listening to a two meter ham repeater which transmits in the area of 147 MHz. The AM transmitter was a few miles away, running many kilowatts. The two meter repeater was running about 10 watts, and was located on a mountain about 70 miles away.

I pulled into a concrete parking garage and parked about 100 feet from the door. The AM station disappeared completely, its powerful long wavelength signal completely blocked by steel-reinforced concrete. The ham repeater signal was weaker, but still perfectly readable, since the shorter wavelength signal was bouncing off neighboring buildings and

through the door to the parking garage, even though its power was far weaker.

I've used my 900 MHz cordless SS phone a full city block away from my house, standing within inches of the far side of a concrete building, with at least two concrete walls and several houses and trees between me and the base unit. The signal has the ability to reflect and refract through small openings and off flat surfaces, where longer wavelengths would be unable to do so.

There are tradeoffs, however, so you can't just keep going higher in frequency to get better coverage.

You are confusing the right to a refund if you don't like something with the right in almost all states under the Uniform Commercial Code to merchantable goods. A retailer sells you something not working and you open it up and it's not working, you can return it. By law.

I'd use a simple home-built feedhorn with a low-noise preamp (at least
<1dB NF)
mounted closeby and low-loss coax.
Cheap KTV coax works nicely for only recieving ..
I only have feedhorn schematics for 1.25 & 1.296GHz , not for ~1.7GHz
which you might
want for weathersats, but there should be on the net somewhere....

The amount of recharges for NiMh's is between 500-1000.
I use the Kodaks in my Kodak DC-240 camera, they are fantastic.
I also use Nexcells. I use a Maha C-777 charger with a 4/8 AA cell
holder.

I recommend checking out:

http://thomas-distributing.com/index.htm

They have great prices on NiMhs and chargers and have FAQS a well.

2416. I GIVE !!!!! BC 245XLT Help ..

Newsgroup: rec.radio.scanner
Date: 2000-01-22 00:00:00 UTC
From: zwerner@rosevc.rose-hulman.edu
Message-ID: <1000122040416018@FrontierTech.COM>
Source record: 95658

I was given a BC 245XLT as a gift, and I still don't have it working correctly for trunk tracking. I've worked with it since Christmas (NOT continuously !!), and have some talk groups set up in it, but I really don't know how I did it. By using all the buttons in a some what random manner, I can now receive some channels with the trunked systems, but I feel I'm missing quite a lot.

I've looked all over the inet for info, and have found several excellent sites, but as far as the basic set up on this scanner I've found very little. Being new to trunking, the manual doesn't tell me alot !! Is there any site which helps program this scanner. I need button by button instructions !!!!! The scanner works great on the regular channels, but trunk tracking is still a mystery for me to program.

I know you don't have to be a EE to program this thing, but electronics and I don't see eye to eye at times !!! Thanks for any help.....

The higher frequency signals go through more. I believe the FCC
has set aside this range for Spread Spectrum.

The easiest way it to split the 70 MHz IF loop on the sat RX. If you
don't have an external IF loop then this obviously will not work.

I think you can send data to the scanner memories. I.E. you cxan send freq's, tags and perhaps ATT and DLY flags but no bi-directional conrol and status reply this scanner can be programmed with PC but not controlled.

This is just like SmartScanner but no dialup connection involved.

I don't have time to argue -- perhaps you could provide a
reference.

>
> >I believe the FCC
> >has set aside this range for Spread Spectrum.
>
> Also wrong, I believe, although I don't have the allocation specs handy.

You're wrong. See sec. 15.247 of the Code of Federal Regulations
Title 47, FCC Rules and Regulations.

Many of the spread spectrum devices on the market today are
listed as Part 15 devices. This
refers to the device operating under the provisions of Title 47
Section 15.247 of the Code of Federal Regulations. There are
three frequency bands allocated to this service:

902 - 928 MHz (26 MHz bandwidth)
2400 - 2483.5 MHz (83.5 MHz bandwidth)
5725 - 5850 MHz (125 MHz bandwidth)

Operation under this provision of this section is limited to
frequency hopping and direct sequence spread spectrum. No other
spreading techniques are permitted. Section 15.247 defines the
technical standards that these systems must operate under. For

example, the maximum peak output power of the transmitter shall not exceed 1 watt. If transmitting antennas of directional gain greater than 6 dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi. This equates to a maximum transmitter EIRP of +6dBW (1 watt into a 6dBi gain antenna) Part 15 equipment operates on a secondary basis. Users must accept interference from other transmitters operating in the same band and may not cause interference to the primary users in the band. Primary users are government systems such as airborne radiolocation systems that emit a high EIRP; and Industrial, Scientific, and Medical (ISM) users. Thus the Part 15 device manufacturer must design a system that will not cause interference with and be able to tolerate the noisy primary users of the band. And this is where spread spectrum systems excel because of their low noise transmissions and ability to operate in an adverse environment.

why ???

75 Z TV cable has less loss anyway
and is quite commonly used at VHF .

: -Subject: Complaint about ONDCP alleged payola to US TV Broadcast
Networks...
:
:
: Dear sirs,
:
: My name is Michael Hess, I am a citizen of the United States and a
: consumer of televised broadcast media.
:
: I would like to formally request that an immediate investigation be
: launched into allegations stemming from a January 14th, 2000 Salon.com
: article where, Barry McCaffrey and the Office of National Drug Policy
: (ONDCP) have been accused of paying off US television networks,
: including "ABC, CBS, NBC, the WB, Fox, and, this TV season, UPN" in
: return for US government sponsored anti-some drug propaganda.
:
: An excerpt from the article makes clear the need for an official
: investigation:
:
: "As disclosed Thursday, the scheme began in fiscal year 1998, when
: Congress appropriated nearly $200 million a year over five years for

: paid anti-drug advertising. But there was a catch: Congress said the
: networks had to give the government a two-for-one deal on the ads.
:
: Instead, the networks and government officials decided that anti-drug
: themes and stories in prime-time TV shows could take the place of the
: free ads. Ultimately, promulgating government-approved propaganda
: afforded the networks the opportunity to earn buckets of extra cash.
:
: The arrangement raises legal questions. Some observers think the
: government may have run afoul of the nation's anti-payola regulations.
: Payola entered public consciousness during the 1950s, when rock 'n' roll
: impresarios were convicted of bribery for paying DJs and radio stations
: to play specific records."
:
:
: In the same article it says the FCC was contacted for comment:
:
: An FCC enforcement bureau official says, "I was not aware [of the ONDCP
: financial incentives]." He adds, "We haven't received any complaints
: yet. If we do receive a complaint, we'll proceed from there."
:
:
: Please accept this as a complaint. I searched your web site for a
: complaint form or an address and got bounced from several of the pages
: there, the email address above is the closest one that I could find for
: the purpose of this complaint.
:
: If this complaint has reached the wrong office please forward it to the
: FCC Enforcement Bureau for immediate consideration.
:
: Thank you.
:
: Sincerely,

NiMH can NOT put out 1.5V! I believe what you say were simply
rechargeable alkalines.

> The package said these could be recharged 1000 times.

I've never seen a battery claim like that! You might get 500 or
a little over with NiCds if they are perfectly charged, discharged,
and maintained. For NiMH, make it 300 or so.

> I was at Walmart and noticed they had Kodak NiMH batteries and a
> charger. I could get the charger and 4 1.2V 1650 mAh batteries for

The 1650 mAh makes those sound like NiMH. But the 500 would be
purely theoretical.

> Why is there such a difference in the number of times these batteries
> could be charged?

Simple...marketing gimmick.

From: khaas <khaas@FFFFFFflash.net>
Message-ID: <2zii4.82$oX4.17714@news.flash.net>
Source record: 95685

Thursday January 6, 3:02 pm Eastern Time
Company Press Release
Ericsson's Private Radio Systems Business Acquired by Com-Net Critical Communications
MONTREAL, QUEBEC--Ericsson Inc. announced today that its Private Radio Systems operations have been acquired by Com-Net Critical Communications, a Pittsburgh, Pennsylvania-based provider of radio network solutions to the public safety and service market.
The PRS business, headquartered in Lynchburg, Va., employs more than 700 people and operates through a worldwide network of dealers and distributors. The division had approximately $300 million of sales in 1999.
Ericsson's sale of its PRS operations is aligned with the company's overall strategy, as announced in October 1998, to concentrate on the convergence of mobility and internet communications. The business strategy requires intense focus on the wireless market. To increase its concentration on those markets and competencies essential to the company's strategy, Ericsson has acquired and divested various business components.
The sale of the PRS division will bring an increased focus on the private radio market by the new company and allow Ericsson to concentrate its resources on the attainment of its short and long-term goals to achieve a market-defining role for the mobile internet.
``We are very pleased to have entered this new business relationship with Com-Net Critical Communications,'' stated Joe Hagan, corporate financial officer for Ericsson Inc. ``Their leadership and focus will ensure the success of the business for our customers and our employees.''
To provide continuity throughout the transition for both employees and customers, Ericsson will maintain an equity ownership in the new company. Com-Net Ericsson Critical Radio Systems, as the new company will be named, will assume Ericsson PRS customer commitments and long-term servicing of current customers who own and operate PRS two-way communications systems and products. The new company will continue to serve the global market with critical communications systems.
``The acquisition of Ericsson's PRS operations manifests our strategy to become a vertically integrated provider of services to the wireless market,'' said Steve Savor, Com-Net's chief executive officer. ``We now have the ability to offer our customers a complete range of alternatives and solutions.''
Private Radio Systems' state-of-the-art Enhanced Digital Access Communications System (EDACS&#65533;) serves more than 450 public safety, utility, industrial, commercial and government organizations worldwide, including the Kremlin in Russia, the French Naval Fleet, American Electric Power, the Denver International Airport, and Miami-Dade County, Fl., to name a few.
Com-Net's current business includes the construction and/or purchase of

wireless networks and systems capable of providing secure and reliable two-way radio communications. With the addition of the PRS product portfolio, Com-Net will be in the position to offer total communications to the land mobile radio market.
Ericsson is the leading provider in the new telecoms world, with communications solutions that combine telecom and datacom technologies with the freedom of mobility for the user. With more than 100,000 employees in 140 countries, Ericsson simplifies communications for its customers - network operators, service providers, enterprises and consumers - the world over.
Additional Information
Ericsson Canada Inc., a subsidiary of LM Ericsson, Sweden, serves the Canadian market by providing complete communication solutions including Wireless Systems & Solutions, Mobile Phones, IP and Data Systems & Solutions, and Consulting Services. In addition, its R&D Centre in Montreal - Canada's sixth largest R&D investor - develops systems for multiple wireless standards as well as technology for future 3rd generation (3G) telecommunication solutions.
Private Radio Systems has an installed base of more than 400 trunked dispatch radio systems and serves public safety, utility, industrial, commercial and government markets worldwide. In Canada PRS has supplied more than 42 systems, including the RCMP in Newfoundland, SaskTel, and the new E-Comm system in B.C.'s lower mainland.

The 106th Congress is trying for more restrictions with the H.R. 514 bill. Representative Heather Wilson and members of The Subcommittee on Telecommunications, Trade, & Consumer Protection started this bill. This bill adds frightening restrictions by requiring the removal of the
SMRS and PCS radio band in radio scanners. SMRS is the Motorola iDEN (e.g. Nextel "Direct Connect") 2-way radios used by Government and in the same radio band as Government public-safety radio systems. Current radio scanners can not decode digital Motorola iDEN. Also, note that radio scanners do not effectively receive PCS because it is very short-range microwave and digital. PCS in fact is bad for mobile

communications because all-direction (Omni-directional) antennas have large signal losses at these high frequencies. Because of this, PCS requires micro-cells or many more cells compared to original 800 MHz cellular. PCS would be better for non-mobile use with fixed directional antennas. As you can see the push by commercial interest and greed for H.R. 514 will lead to restricting Citizens from monitoring
our Government services. It will deny the Citizens ability to have future radio scanners that can decode the new digital modes used by our
Government services. It sounds good when they say it is for your privacy but in reality gives them the dangerously increasing power to close
Government radio communications from the average American. Stop H.R. 514.

H.R. 2369 enacted by the 105th Congress was bad enough and needs corrected.

Your blanket statement about 75-ohm coax is dangerous. Surely you did not intend to say that 75-ohm RG-59 is low-loss and suitable for scanner use.

Haaken20's summary is faultless. Even so, I also might disagree with his recommendation. For my next scanner cable run I will order some 75-ohm RG-6 even though I have two 500-foot rolls of 50-ohm 9913 sitting in the garage, waiting for ham use.

I strongly believe the message below has been posted with fraudulent intent. It is similar in style and detail to a message I responded to on December 4th, 1999. The individual received a money order for $400 USD, cashed the money order, and then refused to send the goods. Complaints are in process through the U.S. Postal Inspection Service and other agencies with jurisdiction.

Has anyone else fallen victim to this individual?

I sent payment to someone describing himself as:

Babak (aka "Bob") Hamidi
85 Springhead Gardens
Richmond Hill, Ontario L4C 5C3
Canada

905-884-8841
877-262-7073 (now disconnected)
416-276-1380 (mobile)

Babak used the following addresses: webhoster@home.com, midnighthacker@home.com.

Any information would be appreciated. And beware of this offer!

Not sure if you can recharge NiMH batteries with the Adaptor that
comes with the 245XLT. If you solder 4 AA NiCad high capacity
cells together, it should work fine.

JnglMassiv wrote:

On the right side there are two rubber caps. One marked sp which is an
earphone jack. The other one is for an AC adapter.

2456. Re: Pro-2052 Scanner Software

Newsgroup: rec.radio.scanner
Date: 2000-01-23 00:00:00 UTC
From: esptwo@my-deja.com
Message-ID: <86fhehtre1@nnrp1.deja.com>
Source record: 95494

Rich, Wayne:

I tried the freeware site Wayne recommended for Pro-2052 computer control software. It works OK after you get through the somewhat convoluted download procedure, but I've been unable to get it to recognize anything having to do with trunking. Still trying.

I corresponded with WinScan after Rich Wells put me on to them & they were kind enough to make me a Beta tester for their WinScanRS program for the Pro-2052. It seems better than the freeware product, but I have to admit the freeware is free. We'll see which comes out the best in the long run.

Lastly, I note that Scancat claims to be shipping their ScanCat Gold, which includes Pro-2052 coverage. Their product seems to do more than any others, but they haven't bothered to answer my e-mail, & it isn't cheap, so I haven't tried it.

On my end, I've had no luck in using the Pro-2052 to trunk track anything, with or without computer control software. I'm uncertain if I'm out of range (15-25 miles away in Prince William County, VA), or if the folks whom I thought were using Motorola Type II systems in VA - Fairfax, Alexandria, Arlington - don't really use it, or if my radio has a defect (other than operator error). I'm either going to have to set up closer in to test, or get another radio checked out locally to see if it picks up anything. If anyone has any ideas or trunk tracking experience in the area I'm in, I'd be greatful.

Overall, I've found the WinScanRS software, even in Beta version, to be quite good. If they develop it further to do things the Pro-2052 itself can't do (like the ScanCat folks have done with ScanCat Gold), they will have a super product.

Looking forward to hearing from you.

Rich - Thanks for the lead to WinScan - they are fine folks and have been very responsive.

Ed Pusey

> Bill K9KZ

Bill, this article is from a website that is concerned with radio monitoring in Lubbock, Texas. Alot of the information should apply to most malls around the country.

Malls are great places to explore with your scanner. In addition to security and maintenance there is a lot to hear on a radio scanner at the mall. The South Plains Mall in Lubbock, Texas is not an exception. These are the frequencies that I suggest that you load into your scanner before your trip to the mall and some hints at finding new frequencies.

Business Band Frequencies

These frequencies are used the most by the individual stores in the malls:
VHF Business Band
151.625 MHz - Red Dot
151.995 MHz - Purple Dot
154.570 MHz - Blue Dot
154.600 MHz - Green Dot UHF Business Band
464.500 MHz - Brown Dot
464.550 MHz - Yellow Dot
467.7625 MHz - 'J' Dot
467.8125 MHz - 'K' Dot
467.850 MHz - Silver Star
467.875 MHz - Gold Star
467.900 MHz - Red Star
467.925 MHz - Blue Star

Family Radio Service Frequencies

This is a new radio service designed for friends and families to keep in touch. Although they are becoming more and more popular they are not common enough that you will hear a lot of traffic. However, they are sold by RadioShack and department stores. It is likely that you can monitor customers just trying them out. Because of their price and decent range it is not uncommon to hear them being used by businesses. There are fourteen FRS (family radio service) frequencies and they are:

Channel 1 - 462.5625 MHz
Channel 2 - 462.5875 MHz
Channel 3 - 462.6125 MHz
Channel 4 - 462.6375 MHz
Channel 5 - 462.6625 MHz
Channel 6 - 462.6875 MHz
Channel 7 - 462.7125 MHz
Channel 8 - 467.5625 MHz
Channel 9 - 467.5875 MHz
Channel 10 - 467.6125 MHz
Channel 11 - 467.6375 MHz
Channel 12 - 467.6625 MHz
Channel 13 - 467.6875 MHz
Channel 14 - 467.7125 MHz

FCC Licensed Frequencies

These are frequencies that are compiled from FCC records. This means that the user of these frequencies has applied for and received a license to operate on the listed frequency. Many companies and individuals don't bother to apply for a license so not every radio user is listed with the FCC.

South Plains Mall Associates LTD. - WNWQ748
461.1250 [466.1250] (85.4) - Maintenance
461.2500 [466.2500] (D244) - Security

Dillard's Department Store - KD4175
461.5875, 461.6875, 461.7375, 464.1375, 464.2125, 464.8375

Best Buy - WPAR320
460.8875, 461.8375, 461.9125

Home Depot - WPLE546
461.2125, 463.2875, 464.6375

Other Reported Frequencies used at the Mall

Old Navy Store - (No FCC License Information)
151.9950

Other Frequencies to Monitor While at the Mall

In addition to the frequencies above there are other more conventional monitoring you can do while you are at the mall. Taxi cab companies, busses, and city police are a few examples.

Taxi Cabs
Yellow Cab - WNMV255
152.360, 157.620

Citibus and the Lubbock Police Department use the City of Lubbock's EDACS trunked radio system. Check for Citibus on talk group 02-101. For the police department check talk groups used for special events like 01-094.

How to Find New 'Mall' Frequencies

1. There are a few tricks you can use to find new frequencies while you're at the mall.

2. When you see a person with a radio observe the style of antenna. VHF radio antennas are usually a thicker and sometimes taller than UHF radio antennas. UHF radio antennas are either thin or very stubby. Search the VHF or UHF business frequencies if you see an antenna such as this.

3. Become familiar with the styles of radios. The new FRS radios are very small and the most popular FRS frequency is Channel One.

4. Use a frequency counter. These tools of the trade capture nearby frequencies and can even automatically tune some radio scanners.

5. If you have the opportunity to observe a radio close up look at the back or bottom. Sometime the frequency that it operates on will be listed. If not, then look for a colored dot or star. Refer to the business band radio frequencies to figure out what frequency these identifying marks are for.

I have the exact same equipment (3 months old)as new with boxes and
manual that I will sell for $550 US. Buyer pays shipping and insurance
from South Carolina.
Thanks

I have one, and have been using Scancat software,
I am happy with it.

It works great with the set up I have now, however,
I am sure it will perform even better when I get the antenna a bit higher
and get some better coax.

I would suggest a look at the Relm HS-200. It has everything you said
you are looking for and is priced at around $200.00. I have one and it
works great!

Bill, Normally I would agree with you if it were anything other than software. The way I see it most software companies are inherently thieve in their own right. I have never bought a piece of software that was not misrepresented in some way; that was not flawed in some way and then being expected to pay for the privilege of beta testing their junk and correcting their mistakes. If ScanMaster is an exception to this I would be happy to pay them, but until then I'll be looking for a warez copy myself. The way I see it if I try it and it does everything it is supposed to do, and I use it regularly, then I'll send them a check. Another thing I have learned being a programmer myself is that ALL programmers are thieves. They all steal code regularly. And there is no honor among thieves. Try not to be so hard on software junkies. I'm sure you have some vices of your own if take the time to think about it.

2489. Battery problem w/ Pro-2006

Newsgroup: rec.radio.scanner
Date: 2000-01-23 00:00:00 UTC
From: Curtin Charles <cmcurtin@earthlink.net>
Message-ID: <X4Li4.2948$bp2.139195@newsread2.prod.itd.earthlink.net>
Source record: 95527

I have a Pro-2006 with which I'm having a problem. It was in storage for a year, and when I went to use it, the battery was dead. I installed a new battery and it will not recognize that it has a good battery. I tried a few different 9v. batteries and checked the leads to the circuit board where it registers 9.58 volts. So the battery is good and the radio is getting power to the circuit board.. I tried resetting the radio. The low/missing battery icon appears and the battery warning beep is present. Radio works fine otherwise.

Any Ideas? - Chuck

Depends on how strong and how far the signals are that you want
to listen to. The higher the better. I would suggest you try it and
see if you are happy with the results. I used to have a small ground
plane in my attic until I got a metal roof. The ground plane worked
rather well but then I the signals in my area are fairly strong.

Thanks. I am considering "resting" the antenna (without a pole) on the
crawl space.

One more question: do I need to tune if it is to be used with a scanner
(no ham transmitting)?

2495. Re: need tip for installing roof antennae.....

Normal loss for a typical splitter is 3db. Should not make much
difference. Height is nice, but assuming that you want to keep it
inconspicuous, as long as nothing is directly blocking it, such as a
masonry chimney, again it will not make much difference. If you are
living in an area prone to lightning, take extra care and make
sure your antenna has adequate grounding. That is a safety issue,
and does make a difference.

Thanks in advance, Al

2498. FS: Alinco DJ-X10 $260 with lots of extras

Newsgroup: rec.radio.scanner
Date: 2000-01-23 00:00:00 UTC
From: kb5fas@postoffice.swbell.net
Message-ID: <388BCF69.B3859147@postoffice.swbell.net>
Source record: 95536

Have an Alinco DJ-X10 for sale which I purchased 7 months ago from Grove Enterprises.

Package includes....

Alinco DJ-X10 w/battery
Drop-in Charger
Original Antenna
Original Box
Original Manual

I have also purchased seperately and will include...

PC Programming Cable
Copy of the Freeware Programming Software
Mobile Power Supply
AC Power Supply (sure saves on the Battery when listening around the house)

The PC Programming Cable was purchased recently thru Amateur Electronic Supply. The two power supplies were purchased thru Radio Shack.

Price is $260 which includes the shipping cost CONUS

Rig is 10/10 - only reason I'm selling is local agencies have switched to trunking systems and most of my monitoring these days is with those agencies. I would rather someone use it and take full advantage of all of the features than have it sit on a shelf here at the house.

Thanks in advance & 73's

>Innocent John!!) Re: Will I Smoke It?

"Your question is TOTALLY off-topic for this NG, but anyway"
[edit]

Given the recent content of this NG, the remarks quoted _above_ are
absurd.

But if you look hard & long enough there are scanner related posts!!!

ps to Mambo Kid: your post, referring to power supplies" is a lot closer
to "on topic" than several hundred others!

Operating with a lower voltage supply (when the electric co. does it,
it's called a "brownout" btw) is as harmful to your eqipment with a
higher voltage supply, such as using 12 vdc for a 6vdc device.

>"Mambo Kid" <mambokid@mailcity.com>
>posted

>"A bit off-topic," so apologies in >advance:"

[edit]

[std. text size]

(No neeI have collected a variety of AC adapters for my scanners over
the years and don't want to buy any more if I can help it. Just bought a
digital camera and wondering if I can use my 300mA selectable voltage AC
adapter -- with 1.5, 3, 4.5, 6, 7.5, 9 and 12 volt settings.
The digital camera requires 6.5v, 250mA.
If I use the adapter at the 6v or 7v setting, think I'll smoke the
camera? Appreciate any thoughts... thanks.)

Hope this helps

uhhh dan?

Your not flaming me?!?!
no i'm not and I stated that

I'm the one who is saying don't do it!
no, but you certainly implied that, and i'm sure every one understood it to be that way,
including me :)

It isn't worth it.
you are very correct, (imho)

read the message before you post next time.
Next time? I did read it before I posted. Did I post something to offend you?
If so I offer my most humble oppologies that was not my intention.
My intention was to reinstate what you said and elaborate on your statement.
Since you seem so offended at what I typed please feel free to tell me exactly
what I typed incorectly so that I may never make that mistake again. :)
And if you do, please don't e-mail directly, post it to ng. rec.radio.scanner
so that we may all learn by this. :)

Thank you,
ryan sutherland

It seems with all the advances in scanners and alpha-tagging, there are fewer ACCURATE web sites. Those that are up are often years old and out-of-date.
If you have a link to a California Highway Patrol freq. site (not dispatch centers), please e-mail me. Thank you very much!

I thought I read somewhere where the higher frequency waves have
less trouble travelling through dense material (like buildings).
I can't seem to locate anything on the subject matter at the
moment.

I don't hate CBers. I was a license CBer in the early 70's. I got my
first ham ticket in 1961 and general class in 62. I currently have an
extra clas ham ticket.
What I don't like about CBers is that fact that they think that they
are above the law. Death threats, profanity, and hate talk dominate
the CB channels. A person running legal power is a rare thing on the
CB bands where I live. If my children were little, I would not
hesitate letting them work the ham bands unsupervised.
But,like the Internet, I would not consider letting my children
work the cB channels unsupervised. That is why hams don't want
the CB set comming up to the ham bands.
Just a thought

In the mid-1980's the FCC transitioned amateur radio testing to Volunteer Examiners (VE) administered by Volunteer Examiner Coordinators (VEC). By the late 1980's the FCC was totally out of the normal amateur radio testing.

I am fortunate enough that I took my technician & general test (theory & CW) from FCC employees at federal offices.

Today, I have been a VE for 10 years & am currently one of the most active VEs in the US, accreditated with both the VEC's of W5YI & ARRL.

Source record: 95559

I ordered a RS roof mount scanner antennae and it comes with 50' of coax cable. I would like to run some sort of splitter from the antennae and run 2 separate cables. One to my living room and another to my bedroom. Will I lose any sesitivity where I connect the splitter? I am new at this external antennae stuff and I want to do it right the first time. Also, i would assume that mounting it higher is better also? I only want it to be a few inches above my standard v-shaped roof.

"Through more" means exactly that. Through small openings and
through dense materials. In fact, materials have "openings" in
them. In the article that I read, it was suggested that the
signal went through certain materials. Object if you will. But
why do you feel the need to be so adversarial? In any case, I
appreciate your explanation below.

2531. Mall Monitoring - Help Please

Newsgroup: rec.radio.scanner
Date: 2000-01-23 00:00:00 UTC
From: Bill <k9kz@indy.net>
Message-ID: <s8leoloqeh675@corp.supernews.com>
Source record: 95569

I just bought a new Icom R2. I would like to go to a local mall or two and see what
I can hear. Any tips or common freqs? Are there any stealth type head phones that are good to use with the R2? I have had the R2 for two weeks and have had
a lot of enjoyment already. The potential for stealth monitoring intrigues me.
Where are some other good places to go to monitor? TIA!

Bill K9KZ

Where is your reference? I'm not inclined to count "in any radio
book" (your reference in another post) as a reference. Anyways,
a reference would be helpful (for many reasons). If I had a
reference regarding higher frequency waves penetrating materials,
I would have surely posted it. The fact is, I don't. If I come
across it again, I'll post it.

I was involved in the whole sordid Cheek affair for a long time, is all,
and I got a LOT of shit for taking him on.

As for the geezer@nursing.home thing, it just started out as a sort of
joke, a random fake address in one particular newsgroup, and it kind of
caught on. Now I'm known as Geezer to a whole group of friends, and we
even have a mailing list and an IRC channel. It has nothing to do with
Mackey, or this group, or any past occupation or anything. I'm old, is
all. Just turned 65 a couple days back.

No not unless you live on the top of mt Everest. A satellite dish is a completely different animal, as signals are beamed from space and hit the Earth at a relatively steep angle. Mount the discone as high as you possibly can to get the best performance!

Good luck

These are the frequencies you should monitor at most Malls:

151.6250 151.6550 151.6850 151.7150 151.7450 151.7750 151.8050
151.8350 151.8650 151.8950 151.9250 151.9550 154.5150 154.5400
154.5700 154.6000

457.5125 457.5250 457.5375 457.5500 457.5625 457.5750 457.5875
457.6000 457.6125 467.7375 467.7500 467.7625 467.7750 467.7875
467.8000 467.8125 467.8250 467.8375 467.8500 467.8625 467.8750
467.8875 467.9000 467.9125 467.9250

461.0000 thru 462.1875 with 12.5Khz step <=== Second most common
463.2000 thru 464.9875 with 12.5Khz step <=== Most common

466.0000 thru 467.1875 with 12.5Khz step
468.2000 thru 469.9875 with 12.5Khz step

Most Malls have at least 3 local repeater frequencies in the 463.2000
thru 464.9875 range and 461.0000 thru 462.1875 range. These usually
consist of a Security Frequency, Maintenance Frequency and Telephone
Frequency. The Telephone frequency is a phone patch system that allows
security to answer the phone when they're not in the security office.

The frequencies in the VHF range and 457 Mhz and 467 Mhz range are
generally used by various Department Stores for anti-theft.

The article is a little outdated now. It turns out that the
Panasonic Gigaphones use direct sequence spread spectrum with
analog modulation, not digital -- there is no digital encryption
of the message. The transmissions can be picked up on a scanner.

if you don't need trunking capabilities, try the Uniden SportCat 200, it has the CTCSS/ CDCSS feature, 800 coverage, as well as an auto-light and alpha tagging. As always, you'll need to upgrade the stock antenna, my suggestion is the Diamond RH77CA. This package should run about $250.

The reason the average age of an Amateur Radio operator has risen as high as it has is because of the attitude of the Amateur Radio operators. Granted, not all share this attitude, but those that don't are the exception, rather than the rule. I for one have been trying to understand this attitude, but have failed. If there are any hams out there who would like to enlighten me, I will be more than happy to further my education. Thanks in advance, Bill.

That is what I meant by "going through more" -- that the waves
can pass through smaller openings. You are splitting hairs.

From what I've heard, Heddy wasn't all that bright. She did, however, look good and at various times was married to 5 different professional men. One of these was an engineer for a defense contractor who would put here name on his patent applications as a token of his love. This is why she is listed on many defense inventions including radio controlled torpedos.

First you have to find out what freq. are being used in your area, you won't
need trunk tracking if you are in someplace like Abilene TX. You may not
even need 800 mhz.

2570. Re: MOD for PCR1000 w/ 4000 plus Serial

Source record: 95401

In article <3888B5C8.DB091DFB@vh.net>, recon@vh.net says...
HTML stuff snipped
There are several sites with good pictures of how to add the 0ohm SMC shunts.
I have "done" several radios, the last being a circa SN#3900 and they all
worked. I have heard that the newest PCR1000 can not be moded with the
shunts.
The mod, while not all that hard, is rather involved and it would be very
easy to ruin the radio. I will no longer mod numbers higher than 3000.

And I have NOT doen this to my PCR1000. Other than the irratation over being
protected from myself by having cell cruap locked out, it is not worth
it to me to take that type chance with my own radio, especaily since I have
enough pain in my life without listening to losers spend $0.50 a minute
to argue, plead or scream at each other.

It is a Broad Band VHF/UHF antenna and as such NO tuning is
necessary. and as a side note the Quanity Discones(Diamond &
ICOM) are designed to transmit in the Ham 6 Meter, 2 Meter and
440 Hhz bands if you are a HAM.

You can actualy jsut sit it on the ground using the Droopjng
Radials to support it. Don't need any special stand. But even
raising it 10 feet above the ground will improve the performance.

Hi,

I'm considering a Yupiteru 9000 Mk II but have heard that the included antenna is useless compared to the one that came with the MVT7100. Can anyone suggest a place to purchase just the 7100 antenna. I'm aware of a lot of other telescoping antennas (Radio Shack 20-006, Watson 889,). Would these be just as good as the 7100 antenna? I have checked the antenna reviews at Strongsignals.net but I would want to see what your personal experiences are with using telescoping antennas on the MVT9000?

Thanks,
Felix

p.s. If you want to reply via e-mail please change the .xae to .ca

Exc. condition, with original box, documents, national freq. guide, earphone, charger/adapter. I am original owner.

Email me directly at this address.
Thanks,
Mike

2577. Antenna suggestion

Newsgroup: rec.radio.scanner
Date: 2000-01-24 00:00:00 UTC
From: Lee <g-k@home.com>
Message-ID: <388C9AAB.65D6829B@home.com>
Source record: 95408

I just got a BX245XLT (excellent scanner BTW), and would like to hook up an external antenna..

My request if for suggestions; R.S. discone??? any others???

My question is: I have an Antron-99 CB antenna, can I use that? If so what kind of RG cable should I use. I have 50 Ohm on it right now...

Thanks in advance....

Lee

2578. Re: Source for Yupiteru 7100 aerials or what other telescoping aerials perform similarly

Newsgroup: rec.radio.scanner
Date: 2000-01-24 00:00:00 UTC
From: Frenshte Esmopielle <ogbone@wilgots.net>

I have a Yupi 7100 and use only the 20-006 RS one. It is far superior to the collapsible, bendable one that came with the 7100. So far as I can tell, the stock antenna is good only to keep my Ovaltine in solution, it will not matter if it rusts, its useless anyway.

Hmmm...Make money for doing nothing???
According to law Hams are supposed to be non-profit operators. This means that they can not be paid for relaying messages...I think.

Fellow Hams don't let the WWW bribe you into forgetting that you are Hams.

Hams need MORE license classes so that they can continue their tradition of being good for nothing.

The ARRL Official Observer program, which Toilet Boy claims to be a
member
of, prides itself on having its observers being anonymous. If he really
is
a member as he claims, then he has violated and compromised the program.
The person to contact regarding this violation is the ARRL Section
Communications Manager because he would have been the person to have
made
the appointment. I have listed the information below.

> Lets do it. Send complaints about John to hq@arrl.org

Complaints about John Mackey should be directed to the ARRL Section
Communication Manager (SCM), ARRL Northwester Division Director and
Vice Director.

They are:

SCM: William Sawders, K7ZM, 19821 Ponderosa St., Bend, OR 97702,
541-389-6258, k7zm@arrl.org

Director: Greg Milnes, W7OZ, 740 SE 24th Ave., Hillsboro, OR 97123,
503-648-6990, w7oz@arrl.org

Vice Director: Jim Fenstermaker, K9JF, 10312 NE 161st Ave., Vancouver,
WA
98682, 360-256-1716, k9jf@arrl.org.

And here lies the major difficulties:
(Please refer to:
http://www.arrl.org/field/regulations/news/part97/)

Prospective hams who are interested in "using"
Amateur frequencies as a cheaper alternative to some
other radio or communications service often never
get past 97.1a and feel this is a justification for what
they do. This is not only illegal as per 97.113.a.2,3
and 5, but is very damaging to Amateur radio as it
puts those communications in direct competition
with other communications services and thus makes
Amateur radio a problem for big and small local
business alike. It is also a doorway by which people
fraudulently or mistakenly obtain Amateur Radio
licenses and gear.

In fact, when one reads in context, all of the part
97.1, 97.113, 97.400 - 407, we find the intent of the
Amateur service rules is to provide a broadly trained
radio resource that may be utilized in an any
emergency or emergency service, when other means
are down, overloaded or were not available for
regular use; rather than to provide over-the-counter
radios and a pool of frequencies to be utilized by
persons trained for a specific agenda obviously not in
accordance with other provisions of 97.1.

Perhaps the truest test is in fact 97.113.a.5, which
specifically prohibits, "Communications, on a
regular basis, which could reasonably be furnished
alternatively through other radio services." This
means that the official in charge of your volunteer
Search and Rescue team has no business sending you
out to get ham licenses and to buy your own ham
radios, because he could just as easily get a public
safety frequency allocation (more appropriately,
common statewide S.R. frequencies) and have you
buy your own radios more appropriate for the task at
hand.

73, Jim

You may send comments regarding my opinion (provided
you have truely read it in full context)
to: ac6tk@cybertime.net

abuse@primenet.com and abuse@globalcenter.net.

Toilet Boy the Liar!! whined and sniveled:

> Richard, I have NEVER initiated any discussions with you.

This is a public forum. Whenever you post, you initiate a
discussion with each and every person who participates in this
forum and whomever decides to respond. You have no choice or
control who will answer.

> If you think I "rant and rave" then simply stop communicating
> with me, add me to your kill filter, & your problem will go
> away.

You are like the moron in a public theater who insists on talking
during the movie. What annoys you is that Bill Cheek, myself, and
many others tell you to shut up. Since you lack the common sense
to *not* act like a jerk, you continue to incur the wrath of the
newsgroups.

> I have never told a lie in my entire adult life.

Such a ridiculous statement implies one of two things. Either
you are a child or you are a paragon of virtue. But, your statement
is a lie. You have been proven a liar by myself and others many
times. For example,

1. I proved you lied about the first date of your appearance on the
Internet.

2. I proved you lied when you denied making the claim about
patronizing under age child prostitutes.

3. I proved you lied when you claimed to have written "several
technical articles" for the ARRL and other technical publications.

4. I proved you lied when you claimed to have adopted your dead
sister's children.

5. I proved you lied when in the span of two weeks you claim to
be married in one forum and single in another.

6. I proved you lied about having college degrees.

7. I proved you lied when you denied you were identified as a known Internet abuser by Joe Greco on his published lists of spammers and idiots.

8. I proved you lied when you claimed you weren't stealing Internet access and your employer terminated you for theft of services.

9. I proved you lied you claimed you've never used fictitious or illegal Internet address.

10. I proved you lied when you claimed you were not the most prolific poster of off topic messages.

11. I proved you lied when you said WD-40 was unsuitable for electronic use by posting another endorsement from Roy Lewallen, w7el@teleport.com, which you ignored.

12. I proved you lied about your place of employment when I posted your work telephone and related data. I also proved that *you* worked at that office and not your retired father.

13. I proved you lied when you claimed that Bill Cheek had never been a member of Mensa.

14. It's been proved by others that you lied when you claimed to have never lost an ISP for your forged cancels.

15. It's been proven by others that you lied when you denied using numerous fake identities on the Internet.

16. It's been proven by others that you lied when you denied you've never blown up a repeater system through your incompetence and total lack of technical expertise.

17. It's been proven by others that you lied when you denied trying to break into other computer systems using Back Orifice.

18. It's been proven by others that you lied when you claimed you had "acquired MORE FCC licenses ... than could be counted on one hand!"

19. It's been proven by others that you lied when you claimed you have made your "lioving from the Radio Communicatoins Field for most of the last15 years."

20. It's been proven by others that you lied when you denied having stalked Bill Cheek for over three years.

21. It's been proven by others that you lied when you denied being kicked off Fidonet by Bill Cheek.

22. It's been proven by others that you lied when you claimed Bill Cheek had been kicked off of Fidonet.

23. It's been proven by others that you lied when you claimed
a police had been filed supposedly about harassing phone calls
made to you at your place of work.

24. It's been proven by others that you've emailed death threats
to your detractors on the Internet.

25. It's been proved by others that you lied when you claimed to
"have helped resolve" the problems of the scanner newsgroups
and have "rid this NG of trouble makers."

26. It's been proven by others that you lied when you denied
sending bogus complaints using aliases to the Internet providers
of your detractors.

You'll probably claim none of this happened and snip it out in
your denials. You'll scream for verifiable proof and won't accept
that the proof resides in the archives of DejaNews, silently
waiting to prove your lies. You keep forgetting that many of the
people here in the newsgroups today were here when those events
occurred and remember with vivid clarity your lies and when you
were caught in them.

> > You claim Cheek never had a commercial license because the
> > FCC is unable or unwilling to confirm it

> Correct.

Because *you* cannot confirm the existence of the license doesn't
prove it doesn't exist. It only proves your impotence in this
matter.

> > I made you jump through the hoops about the "error" in the
> > issuance of your amateur radio license to show just how
> > obsessed you are with

> > Cheek told you that he had a First Class Radiotelephone
> > License with Radar Endorsement that was issued in 1966.
> > You acknowledged that when

> NO!! He told me he had a First Class General Radiotelephone
> License, no such license has ever existed with the US FCC.

Bill and I had a good laugh over this one. What you don't know
is that Bill deliberately made that "error.". He wanted to measure
the magnitude of your obsession with him and he reasoned that the
more you jumped on the "error", the greater your obsession. From
your reactions to this test, Bill realized that you are like a
stupid dog mindlessly and endlessly retrieving the stick his
master throws. Bill kept throwing and throwing the stick and you
kept returning it. Pavlov would have been proud of you Toilet Boy.

> > I know the license is real because I held it in my hand and
> > read it. If you don't believe me, I don't care. This is as
> > close as

> The NG didn't ask YOU to be the assessor of this, the NG asked
> him to present his credentials for the NG to review.

If you keep repeating this lie, you'll eventually come to believe it Toilet Boy. The "newsgroup" never asked Bill anything. YOU asked for this data.

What you don't seem to accept is now that Cheek has left the newsgroups and with his state of health declining, he will probably never return. That means you're NEVER going to get the answers to your questions about Bill Cheek. A sure sign of your immaturity is your inability to accept this fact. Get over it and get a life Toilet Boy.

The sad part of all this is that I'm losing my friend. Many others have expressed similar sentiments towards Bill Cheek, too. The newsgroups have lost a friend and an asset and, in return, they're stuck with you Toilet Boy.

But, on the other hand, Toilet Boy, you're stuck with me. Now go fetch.

Lee,
You'll want to stick with 50 ohm coax regardless of using your CB antenna or RS Discone. I have a Discone and love the thing, works great. Now, there was a time when I used a CB antenna and here's what I found.

Good coverage of the VHF-Lo range (30MHz - 40MHz) which was good because my local fire companies used 30MHz. However all other frequencies were not much better than using the rubber antenna. The reason is because of the coil you'll find in your CB antenna, it acts as a chock to the higher frequencies. If you're in a pinch and need to use the CB antenna, short out the loading coil and you'll improve preformance.

> be married in one forum and single in another.

Present your proof here also.

> 6. I proved you lied about having college degrees.

I do have degrees.
Present your proof here also.

> 7. I proved you lied when you denied you were identified as a
> known Internet abuser by Joe Greco on his published lists of

Acually, that was your hero Bill What's-his-name near San Diego
that was identified as a known Internet abuser by Joe Greco.

> 8. I proved you lied when you claimed you weren't stealing
> Internet access and your employer terminated you for theft

The above never happened, present your proof!

> 9. I proved you lied you claimed you've never used fictitious
> or illegal Internet address.

I have NEVER used a fictitious or illegal Internet address, present your
proof!

> 10. I proved you lied when you claimed you were not the most
> prolific poster of off topic messages.

I am NOT the most prolific poster, present your proof!

> 11. I proved you lied when you said WD-40 was unsuitable for
> electronic use by posting another endorsement from Roy Lewallen,

I still stand by my original statement, Roy is incorrect. That certainly
is NOT a lie!!

> 12. I proved you lied about your place of employment when I
> posted your work telephone and related data. I also proved that
> *you* worked at that office and not your retired father.

Wrong again. Present your proof!

> 13. I proved you lied when you claimed that Bill Cheek had never
> been a member of Mensa.

I never said that he had "never" been a member of Mensa. I said
that he was "NOT" a member of Mensa. Once again you are wrong!!

> 14. It's been proved by others that you lied when you claimed
> to have never lost an ISP for your forged cancels.

Wrong, I have never lost an ISP or forged cancels. Present your proof

> 15. It's been proven by others that you lied when you denied
> using numerous fake identities on the Internet.

Wrong again, see number 9 above!

> 16. It's been proven by others that you lied when you denied
> you've never blown up a repeater system through your incompetence
> and total lack of technical expertise.

I have never blown up a repeater system, present your proof!

> 17. It's been proven by others that you lied when you denied
> trying to break into other computer systems using Back Orifice.

I have never done such a thing, present your proof!

> 18. It's been proven by others that you lied when you claimed
> you had "acquired MORE FCC licenses ... than could be counted
> on one hand!"

Wrong , again!!!
I have passsed more FCC license tests than can be counted on one hand.
I NEVER said it had more FCC licenses than cam be counted on one hand.
Please Richard, pay attention to what I say!

Richard, out of the first 18 accusations you have made EVERY ONE OF YOUR
STATEMENTS IS WRONG!!!!! I'm not going to bother anwering all the rest
because
they are ALL WRONG!! Present your verifiable proof or forget it & back
off!!!

I've got one and think it's terrific, especially when traveling. The audio output is rather pathetic, so I'd suggest an external speaker be plugged into it to
improve the audio quality.

Granted, it's not the greatest scanner ever built and doesn't cover everything, but it's handy and very simple to operate. It's nice to go on a trip and
have your radio hobby to help pass the time without having to program in any frequencies. My only disappointment is that it's powered by DC current only and I wish it would also operate on AA batteries.

The 7100 telescopic antenna is about 2ft 6 inches long and connected to
a BNC plug. Any similar arrangement will work as well.

2598. 90 + posts by Mackey in 2 weeks and not 1 is useful!

Newsgroup: rec.radio.scanner
Date: 2000-01-24 00:00:00 UTC
From: "cg@NOSPAM.com" <cg@NOSPAM.com>
Message-ID: <19D20CEF46E8D991.5F5E2375AF4BD06F.57D1C9FA68459098@lp.airnews.net>
Source record: 95429

Subject says it all.

You know I could care less about all this Mackey BS.
Problem is - this Mackey gimp insists on changing his name
to avoid my filters.

The sad thing is, all of you that participate in this guys bullshit
are all DESTROYING rec.radio.scanner.

But then all of this discussion concerning this isn't about radios,
it's about egos isn't it.....

EVERYONE needs to think for a second. Why bother posting
against Mackey? All he does is reply/rant, which spreads more BS.
Never anything useful. Anyone who reads rec.radio.scanner for a month
or two will notice this. Why encourage him?

And Mackey - when the hell are you going to grow up? You're the reason
this crap has continued for the 1+ years I've been reading
rec.radio.scanner. How many times have you changed your Usenet
identity already? And please don't feel the need to reply to this - I
don't want/care to know. just stop it - Believe it or not, the
majority of the people that read this group don't care.

I've always thought moderated groups suck. However, after the hundreds
of posts I've seen of this Cheek/Macky crap - perhaps moderated is
just what these ego tripping adults need to make them take thier BS
elsewhere.

This concludes this post. This will be the only post I will make on
this subject - I doubt it'll change anything. The sad thing is, all of
this crap is is just helping to destroy an already dying hobby.

If your SD has encryption capability on a channel using CTCSS, by having the CTCSS programmed it will lock out the squelch noise you would normally hear when they "scramble".

The following NYT article might give readers of this news group some insight into the psyche of a particular individual who constantly abuses the group.......

Why the ignorant are blissful
Inept individuals ooze confidence, study finds

by Erica Goode
The New York Times

There are many incompetent people in the world. Dr. David Dunning is haunted by the fear he might be one of them.

Dunning, a professor of psychology at Cornell, worries about this because, according to his research, most incompetent people do not know they are incompetent.

On the contrary. People who do things badly, Dunning has found in studies conducted with a graduate student, Justin Kruger, are usually supremely confident of their abilities -- more confident, in fact, than people who do things well.

"I began to think that there were probably lots of things that I was bad at and I didn't know it," Dunning said.

One reason that the ignorant also tend to be the blissfully self-assured, the researchers believe, is that the skills required for competence often are the same skills necessary to recognize competence.

The incompetent, therefore, suffer doubly, they suggested in a paper appearing in the December issue of the Journal of Personality and Social Psychology.

"Not only do they reach erroneous conclusions and make unfortunate choices, but their incompetence robs them of the ability to realize it," wrote Kruger, now an assistant professor at the University of Illinois, and Dunning.

The deficiency in "self-monitoring skills," the researchers said, helps explain the tendency of the humor-impaired to persist in telling jokes that are not funny, of day traders to repeatedly jump into the market -- and repeatedly lose out -- and the politically clueless to continue holding forth at dinner parties on the fine points of campaign strategy.

Some college students, Dunning said, evince a similar blindness: after doing badly on a test, they spend hours in his office, explaining why

the answers he suggests for the test questions are wrong.

In a series of studies, Kruger and Dunning tested their theory of incompetence. They found that subjects who scored in the lowest quartile on tests of logic, English grammar and humor were also the most likely to "grossly overestimate" how well they had performed.

In all three tests, subjects' ratings of their ability were positively linked to their actual scores. But the lowest-ranked participants showed much greater distortions in their self-estimates.

Asked to evaluate their performance on the test of logical reasoning, for example, subjects who scored only in the 12th percentile guessed they had scored in the 62nd percentile, and deemed their overall skill at logical reasoning to be at the 68th percentile.

Similarly, subjects who scored at the 10th percentile on the grammar test ranked themselves at the 67th percentile in the ability to "identify grammatically correct standard English," and estimated their test scores to be at the 61st percentile.

On the humor test, in which participants were asked to rate jokes according to their funniness (subjects' ratings were matched against those of an "expert" panel of professional comedians), low-scoring subjects were also more apt to have an inflated perception of their skill. But because humor is idiosyncratically defined, the researchers said, the results were less conclusive.

Unlike their unskilled counterparts, the most able subjects in the study, Kruger and Dunning found, were likely to underestimate their own competence. The researchers attributes this to the fact that, in the absence of information about how others are doing, highly competent subjects assumed that others were performing as well as they were -- a phenomenon psychologists term the "false consensus effect."

When high scoring subjects were asked to "grade" the grammar tests of their peers, however, they quickly revised their evaluations of their own performance. In contrast, the self-assessments of those who scored badly themselves were unaffected by the experience of grading others; some subjects even further inflated their estimates of their own abilities.

"Incompetent individuals were less able to recognize competence in others," the researchers concluded.

In some cases, Dunning pointed out, an awareness of one's own incompetence is inevitable: "In a golf game, when your ball is heading into the woods, you know you're incompetent," he said.

But in other situations, feedback is absent, or at least more ambiguous. All of which inspired in Dunning and his co-author, in presenting their research to the public, a certain degree of nervousness.

"This article may contain faulty logic, methodological errors or poor communication," they cautioned in their journal report. "Let us assure our readers that to the extent this article is imperfect, it is not a sin we have committed knowingly."

I think he really means a Console command (32-bit) that runs from the
command prompt, i.e. and command line interface, not really DOS.

Y'all are making assumptions that ought to be explicitly mentioned :-)
Not all telephones duplex in the frequency-domain; while I have yet
to view it on a spectrum analyzer, I'm reasonably certain my ATT
9520 telephone is time-domain duplex. This eliminates the need
for at least one dielectric resonator entirely, those little
ceramics aren't cheap.

For what it is worth, I did not find any convention dielectric
resonators in the 9520's radio. Just several ASICs, a EEPROM and an
RF MicroDevices RF2155 PA chip and a handful of glue (probably a
PIN diode or two for the T/R switch).

web broadcasting of scanners is legal if its Public Safety such as Police, Fire, EMS and Air Traffic Control. there are many sites that do it such as http://www.policescanner.com

in vehicle laws regarding scanners are different for each state in the U.S.

I have been semi into listening to scanners for about 20 years. I have heard a rumor that the local sheriff's freq. has a ctcss tone on it or it is encripted now. The freq. is 155.310. It now has a lot of static on it when they key up. I hear some of them talk very clear and some I do not. I believe they are in a transition at this time. I have a 760xlt that has ctcss. I have never used it. Can anybody show me where to go to get the tones and how to use them? I have the manuel that came with the scanner. I don't have the tones to enter into the scanner to go with the freqs. Can anybody help me with this confusion?

>(no ham transmitting)? Thanks.

Discone antennas are a very wideband antenna and you don't even need to tune much for transmitting. But to really answer you question, no tuning is required for using with your scanner. You'll enjoy the discone, I have one and love it.

Not too sure about tuning a discone. A discone is meant to be a
wide band 0 gain antenna. Basically the upper limits are determined
by the space between the disc and the cone and the lower limits
are determined by the length of the elements. Some discones improve
the lower end by the addition of a vertical element on top.

If you are interested in a particular band you might try making a homebrew
ground plane tuned to that band.

Hi All,

Can anyone help me with the Discriminator output for

1)AOR-AR1500..

I have found out that the chip is MC3372 and pin 9.
The problem is to Locate the chip without breaking anything.As AR1500 is a handheld scanner,
everything is small.

After opening it there are 3 PCB and if someone could just help me to Locate the MC3372

2)Black Jaguar BJ200-MKIV made by PALCOM Electronics Japan

I have tried the net and can't get any info

After opening I found chip MC3361BP and assumed all was Ok

Connected to pin 9 and nothing happens

Any help will be appreciated

If possible Please mail directly :bimal296@intnet.mu

Thank you

YEAH,

Do not sell your stuff to this guy unless he offers at least $100 JUST FOR THE CARD.

Satellite pirates need particular cards to be able to program themselves and pirate DSS. The F card bidding starts at around $100 on ebay and in other news sites. Don't let this guy take advantage of you!!!!!!!!!!!!

The truth is "H" cards can demand $300.00 plus dollars, "F" cards are worth nothing, and "HU" cards are what are sold with the new system, and are worth very little as they can't yet be reprogrammed

So this person may want to buy your "system", but all they do want is the card. The receiver and dish will end up in the dumpster unless the are 3rd generation. Then it goes to Ebay.

Jim

>I'm looking to spend approximately $300.00 on a new scanner.

> I want to get a handheld unit with
>trunk-tracking capability and a PC interface.

I got my bearcat 245xlt for $210 shipped. It has pc interface and Trunktraking II (Motorola/EDACS) and so far appears to be a great scanner. Even comes with the pc interface cable, ac adaptor, earbud, belt clip and average rubber duck. Plus, at this price, you'll still have enough to spring for the radio shack telescoping loaded antenna. This $10 beaut is definitly the best for the money.

Try www.bills2way.com/equip/scanners.html

Good luck,
brendan

CTCSS has nothing to do with encryption.

CTCSS stands for Continuous Tone Coded Squelch System. It's a system
in which a subaudible tone is broadcast along with the voice carrier,
which opens up the receivers squelch. This receiver can be a handheld
radio operating on simplex, or a repeater's squelch or CTCSS equipped
scanner.

PL, stands for Private Line, a Motorola name for CTCSS

It's a system used typically when multiple organizations want to share
the same frequency within the same area.

There are standard tones, but there are also non-standard tones in use.

These are the 38 standard CTCSS tones used by Motorola systems:

Tone 01 67.0 Hz Tone 20 131.8 Hz
Tone 02 71.9 Hz Tone 21 136.5 Hz
Tone 03 74.4 Hz Tone 22 141.3 Hz
Tone 04 77.0 Hz Tone 23 146.2 Hz
Tone 05 79.7 Hz Tone 24 151.4 Hz
Tone 06 82.5 Hz Tone 25 156.7 Hz
Tone 07 85.4 Hz Tone 26 162.2 Hz
Tone 08 88.5 Hz Tone 27 167.9 Hz
Tone 09 91.5 Hz Tone 28 173.8 Hz
Tone 10 94.8 Hz Tone 29 179.9 Hz
Tone 11 97.4 Hz Tone 30 186.2 Hz
Tone 12 100.0 Hz Tone 31 192.8 Hz
Tone 13 103.5 Hz Tone 32 203.5 Hz
Tone 14 107.2 Hz Tone 33 210.7 Hz
Tone 15 110.9 Hz Tone 34 218.1 Hz
Tone 16 114.8 Hz Tone 35 225.7 Hz
Tone 17 118.8 Hz Tone 36 233.6 Hz
Tone 18 123.0 Hz Tone 37 241.8 Hz

Tone 19 127.3 Hz Tone 38 250.3 Hz

I was going to do the same but couldn't obtain the right plug. So I had my local Batteries Plus make a NiHM
pack for $20. and when that or the original pack goes bad I will rebuild it myself. If you have access to
shrink wrap OK. Other wise electrical tape works well having used it for a 200XLT which has 6 batteries in the
pack.

A excellent scanner shop is located just outside of Toronto approx.20-25 min drive east....it is in WHITBY "DURHAM RADIO" 1380 hopkins st. unit-10.toll free#1-888-426-1688 or 1-905-665-5466. Yes scanning is legal in Canada and you can have them in your vehicle as well.(common sense applies i.e. dont go chasing emergency vehicles etc...) Toronto police utilize the motorola trunking system.you will find the info at...http://www.globalserve.net/~ebowlby/index.html
Good luck.ANDROID

You do have a right. However, there are limits to "free" speech. One of them is the use of speech to squelch the rights of others. The airwaves are not "free" --nor have they ever been. A better comparison would be to the National Forests. LPFM sounds to me a lot like squatters applying for the right to build villages in a National Forest.

>ï¿½ï¿½Napoleon Williams and Black Liberation Radio showed them that they
>didn't have a choice. Napoleon Williams is the Rosa Parks of radio.

Excuse me for doubting, but I plan to wait a decade or two before evaluating any statement like that. Let's see if LPFM is going to do anything for the community, first.

>ï¿½ï¿½All the news stations should be looking to interview him. Black
>people should be singing praises to him. Today we should be proud of the

>forgotten hero. Napoleon Williams, wherever you are for all you've done
>and for all your suffering my brother I Thank you and when others wake
>up they will thank you and your family too. WE MUST BREAK THE BLACKOUT
>ON HIS STORY!

Let's ask ourselves a question, shall we? Who is going to listen to this station? Who is even going to know that it's there? What's going to attract listener's attention? Where is the blackout, really?

I think the idea of a neighborhood station is quaint. Few people stay in neighborhoods any more. What's the use of a radio station if it isn't there when you are?

Don't get me wrong, I don't like the big business conglomeration of radio, either. They have managed to "standardize" all of the creativity from radio that it ever had. Now we're left with pablum and dreck. But LPFM isn't going to fix this problem. This problem is one of too much corporate ownership of large stations.

If Napoleon Williams can fix that, I'll call him the Martin Luther King Jr. of radio. Until then, I'll remain quite skeptical.

Interesting question! I tend to think not because your FM transmitter
is regulated by part 15. You're not broadcasting to anyone else,
you're just trying to get the audio in to your truck's stereo system.

However, I'm no communications lawyer, so this advice is only worth
what you paid for it...

In alt.radio.scanner, gwbaker@mindspring.com (Bill Baker) wrote:
> I have been out of scanning for about 5 years ...
> The law as it stood then was - Cordless listening is legal ...
> Has this changed?

Yes.

The following is a re-post of a short dissertation on the various laws
and their effect.

The laws of the United States, passed by Congress, are codified as the
United States Code (USC). It is divided into titles covering various subjects.
Title 18 includes the criminal laws and penalties; Title 47 covers
telecommunications. A law can be refered to by its original name (i.e. "The
Communication Act of 1934") or its entry in the USC. A specific section
would be refered to by title/USC/part/section, i.e. 47 USC 605.
To carry out the law, the various government agencies create regulations,
which are codified as the Code of Federal Regulations (CFR). It is likewise
divided into titles, with the FCC's rules in 47 CFR.

18 USC 119 bars the disclosure of any electronic communications to
which you are not a party (with certain legal exceptions), and sets the
penalties. 47 USC 605 (the Communications Act of 1934) also bans the
disclosure or use of third-party communications. With minor changes, this
has been the law for 60 years.

In 1986 Congress passed the Electronic Communications Privacy Act (the
ECPA), which added definitions to the law that banned listening to cellular
telephones. It also banned the monitoring of broadcast auxiliary, SCA and
scrambled signals.

In 1992 Congress passed the Telephone Disclosure and Dispute Resolution
Act (TDDRA), which instructed the FCC to ban the manufacture or import of
scanners capable of receiving cellular. In accordance with this law, the FCC
modified 47 CFR Parts 2 & 15, effective 26 April 1993. Note that this does
not affect the sale of such scanners, so long as they were made or imported
before the cutoff date. It also does not bar individuals from modifying
their receivers.

On 25 Oct 94, the Digital Telephony act was signed. Buried in one of the
additional sections was a change to 18 USC 2510 & 2511 that added cordless
phones to the original ECPA ban on receiving cellular.

In short:
It is illegal to manufacture or import cellular-capable scanners.
It is illegal to listen to cellular (and cordless) transmissions.

It is illegal to divulge any communication to which you are not a party.

I'm trying to log the decoding of the CTCSS tones through my scanner. Have not had much luck with any of the wares I've had access to on the net. I used a comm. program and was able to get it to spit out the tones. My problem is I can't get it to send the freqs that it stops on. I found the list of commands the Uniden has, using this I was able to get a log of CTCSS tones. Does anyone know of a command so that the freq. of the channel the scanner is stopped on will be sent?

Thanks
Jim

Also used by the VA Hospitals. Whatever is a frequency used by the federal government.

Folks,

On 155.490 non trunked (Simplex I believe) a police mobil unit had an open Mike. The dispatcher radioed to the same unit telling him he had an open mike on the same 155.490 frequency. How is this possible ? If the radio has an on mike in the mobil unit how can he recieve at the same time on the same frequency ?

Thanks for your help in assisting me with understanding this .....

Thanks,

Joe

>i saw on The Simpsons they were able to pick up cell calls on their baby
>monitor because they had a cell tower in their house. is this possible?

Unlikely; however, the 850 MHz cellular band supports the FM mode just like baby monitors. Since the cellular spurs would be down 60 dBc for FCC compliance, and the RX band energy would be down
95 dB so that the TX power does not desense the RX band, the only way that this can happen is if the baby monitor has a real crappy wideband front end.
At the same time it would have to have good sensitivity, which would be ironic.
The real chance of this happening is about the same as if Homer got struck by a bolt of lightning while
standing next to Ned preaching the good life, while Marge is bowling with her boyfriend.
But if Gilligan could detect distant radio stations with his tooth fillings, I'm not sure:-).
Al

An excellent post. I too am an Amateur and have enjoyed radio all of my life. It's usuall the old timers that are still bitter about losing 11 meters. I believe that most newer amateurs respect CB'ers as radio enthausists and not some lower class citizens. Eventually the "old" folks will become SK's and we can once again get into sharing the fun of radio. Unfortunately I think the latest thing will be..."I'm a real ham because I had to learn code...."

This post got me thinking as to whether there would be
the same loss at the receivers with the splitter placed
at the antenna with two coax cables running from it
versus a single cable with the splitter at the tail end
feeding two radios. It would seem to me that there
might be less loss with the splitter at the antenna.
Any comments?

sure its only $10 bucks, but I find the Diamond RH77CA out performs it, and,
the whip is easier to deal with and puts less stress on the BNC connector.

as for the radio.. the alpha tagging on the SportCat 200 is a pure joy (if you
have trouble remembering who's on those infrequently heard freqs) and sets it
above the BC245 IF you don't need to worry about trunking.

Thanks to those who responded both via e-mail and this newsgroup.
You guys were a big help. I had done quite a bit of searching.

George,

Thanks for the tip. I think I may pick up a discone and out it in the attic. I already have a beam and the antron up on the roof and it is a very small house. For the time being I'll use the A-99 and be glad I don't have to change coax :)

2693. ** New BC895 Software coming soon.. requests?

Newsgroup: rec.radio.scanner
Date: 2000-01-25 00:00:00 UTC
From: News <slyster7@mn.mediaone.net>
Message-ID: <N89j4.4$r14.4300@typhoon3.rdc-detw.rr.com>
Source record: 95355
Body handling: HTML body converted to readable text

I have been working with a few other programmers developing a new software package for the BC895XLT. It's going great and I think people will really enjoy this release! It will be cheap- shareware, maybe $5.00-$10.00 or so. It runs in a DOS windows, but is quite powerful for scanning and recording frequencies, identifying frequencies, load and saving banks, recording hits from bank searches, and more.

** Any requests while I am writing the software?
(We can't think of
everything!)

2698. 169.4500 What is it???

Newsgroup: rec.radio.scanner
Date: 2000-01-25 00:00:00 UTC
From: The NeXus <nexus@datasync.com>
Message-ID: <86jde7$e0v$1@news.datasync.com>
Source record: 95360
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi all.. I've been doing some major researching on the web
and not been able to come up with much, I only found a couple
of references to this frequency 169.4500 mHz one was Army Corp
of Engineers and FEMA. But here in Mississippi on the Gulf Coast
I came across this frequency the other night with extensive
activity. Both in the clear and DES transmissions. They are on
a repeater with a tone of 100.0 Hz and its a pretty good repeater
from what I can guess its 4 Cities to the west of me in Gulfport.

Their units in the field have callsigns like 2825ALPHA or 313BRAVO
and their control station goes by SECTOR. Sector apparently is a
dispatch on control point with NCIC, NLETS and other information
sources because units in the field have been running people's tags
running Criminal History (CQH), Triple-I checks, and other unknown
non-standard LE checks and background runs. Sector has been giving
the usual stuff that most police departments would get back but they
also have been running things that I've not heard before to the likes
of boarder crossing information and other references that are not of
local interest. This is not some small operation, its well established.

Just tonight they were running a Surveillance in the Grand Casino,
one of the MANY casinos here on the Mississippi Gulfcoast, following
subjects into the casino. There were several conversations using DES
as well...

I am puzzled as to who this agency is and thats why I'm posting here
trying to find out if anyone knows of a federal agency which does LE
activity on 169.4500.

Agencies we have with an office (to my knowledge) here are:

US Customs (Blue Lightning Task Force)
MS GAMING COMMISSION
US BORDER PATROL
FBI
BATF

Please help if you can, also for quicker response please email me
as well as posting a followup in here.. nexus@datasync.com

2699. WARNING - this is a 'what scanner is best?' question ...

Newsgroup: rec.radio.scanner
Date: 2000-01-25 00:00:00 UTC
From: Graham White <graham@reply.to.group>
Message-ID: <oKaj4.49694$Dv1.1172705@news2.rdc1.on.home.com>
Source record: 95361

I know I know i apologize to all of you who have answered this question billions of times - i have done a little bit of research, but still this is the best way to generate results...

Here is what i'm looking for:

I live in the Toronto area and would like to listen in on the air traffic in the area. And that's it. Since i know the frequencies i'm after, i really don't need the actual scanning functions of most scanners. I'm also not looking to break the bank on this one, but at the same time am looking only at hand held units.

So - what are my options? What is the best value? An where can i get them?

Thanks *very much* in advance,
gw

Es en espa&#65533;ol y parece serio. Cobras unas 75 pts/hora y solo tienes que tener una franja de 60 pixieles en el navegador en la que ves publicidad. Recibes un cheque en casa con el total cada mes. No tienes que hacer ning&#65533;n gasto, solo instalar el programa y darte de alta. Si quieres mirar directamente la web es:

http://www.InteliSurf.com/index.asp?RefID=308

PD.: Si te inscribes te agradecer&#65533;a que usaras mi ID (308).

M&#65533;s informaci&#65533;n:
Asunto: Yo ya cobro por navegar

Hola XXXXX:

Aunque parezca increible, es cierto. Una empresa espa&#65533;ola, Intelisurf, est&#65533; pagando a sus usuarios por navegar por Internet.

Ya hay mas de 4 millones de usuarios inscritos en servicios similares en todo el mundo, pero esta es la primera empresa en Espa&#65533;a y paga a todos los usuarios espa&#65533;oles.

Inscribirse es totalmente gratuito, de hecho, no hay que pagar nada de nada, solo hay que instalarse la barra de navegaci&#65533;n que tienen en su web y listo, a partir de ese momento te pagan por el tiempo que est&#65533;s conectado a Internet.

Lo mejor de todo es que la Barra de Navegaci&#65533;n funciona independientemente de los sitios que visitas, as&#65533; que puedes navegar a tus anchas, como has hecho hasta ahora.

Al final de cada mes, te envian un cheque con el dinero que tengas acumulado en tu cuenta.

&#65533;Donde est&#65533; el truco?, me preguntan algunas personas.
No hay truco, se trata de beneficios compartidos.
En la barra de navegaci&#65533;n, se presentan unos mensajes publicitarios, que se venden a las empresas, una parte del dinero obtenido de la publicidad, se reparte entre los usuarios, es decir, entre todos nosoros.

Cuando te inscribas, recuerda incluir mi Identificador de Referencia, que es el n&#65533;: 308 ya que tambien recibes un peque&#65533;o porcentaje por cada amigo o conocido que se inscribe al servicio; o para que sea mas sencillo pon en tu navegador esta direcci&#65533;n:

http://www.InteliSurf.com/index.asp?RefID=308

Y no te olvides de contarselo a todos tus amigos, conocidos y compa�eros, as� tu tambi�n podr�s ingresar alg�n dinero extra.

Ya sabes, cuanto antes te inscribas, antes empezar�s a cobrar.

Hasta pronto, cu�ntame como te ha ido

Willi, I'll bet a brand new $100 bill against a road apple that I have made more scanner related posts in this news group than YOU have and you can even hold the stakes in your mouth! How's that for a deal? I'm glad to see that you have me listed second, right after Charlie. What about Glenn Hansen? Did you leave him out intentionally or do the gentlemen that you listed just stick in your craw more than old Glenn? Heh, Heh! I can understand your sticking up for your fellow traveler, Mackey, being the two of you are joined at the hip and all but you should be a LITTLE more factual.

Regardz,

Peter Boe aka Willi, J. Henry, J. Mackenzie, etc. etc. why do you whine and kvetch so? You and your pathetic skitzoid selves have done nothing but prattle on about Cheek and the Cheek-a-likes for years as though you are some how better than they are. Nope, Peter, you are just as bad--probably inferior because you lack courage.

Really, some time you must tell us why you are so virulently anti-Cheek. He once said that you tried to hit him up for free product and when he refused, you went gaga. Is that it?

And when the guy is dead and gone, will you still be wandering around like one of the ghosts in Scrooge, moaning about things that never were and might have been?

Whooooooooo.

Order the 7100 aerial from whoever you get the 9000 from.

If you mention the reception problem, you may get a discount.

I was the one who found the Yuppie 9000 aerial is deaf and spread it about.

For some more detail on the problem, I can supply some attachments to read.

E-mail me privately.

Source record: 95375

Well, this is an old thread now, but I was gone for a few days, so thought I'd still add my two cents...

The situation of low powered stations popping up is already happening - in fact several were waiting in the wings. In the last three months, the FCC has given temporary licenses to low power staions (before the official announcement, only to "translators") on 91.1 Mhz throughout southern California. This happens to be just one frequency I have investigated, but I beleive the situation is similar on several other frequencies. These low powered stations are all located at a spacing of around 40-50 miles apart. Lancaster, Van Nuys, Inglewood, Placentia, Running Springs, Palm Desert, Hemet, Fallbrook...those are the locations listed on the FCC website as either being granted temporary permits or having applications in process for transmitters/translators.

There were also numerous sites in Central and Northern California that I can't recall at the moment. I did not investigate locations outside of CA. For all the locations listed above, the liscenses have been granted to a couple of locally well known conservative Christian churches. Not sure if that is a trend, or just who happened to apply for the liscenses enmass for this particular channel. (But none of these applicants are Black run organizations, I can tell you that much).

The reason I ended up investigating all this and went to the FCC website in the first place was for purely selfish reasons. I was very annoyed because these new stations are interfeing with my enjoyment of a radio station that I have listened to for over almost two decades. It is an alternative radio station known as "91-X" which has studios in San Diego, CA, but a 70,000 watt (or perhaps greater, as I recall) transmitter located in Baja Califronia, just across the US border. The actual call sign in XETRA-FM. I live in Orange County, CA, and with the exception of a few areas in the county, I have always enjoyed good, uninterrupted reception of this radio station. Well, no longer. On a stationary radio in my home, depending on the weather (atmospheric conditions), I now either have crummy reception of 91-X with a religious broadcast station (can't identify it better than that since they rarely or never give out any call sign) fading in and out over it, or just crummy reception of the relgious broadcast station.

In the car, reception all depends on which block I happen to be driving on at the time. For example, driving down I-5 from Anahiem to Mission Viejo, I found myself laughing as I heard not one, not two, but four of these stations fading in and out on top of each other over a stretch of about 15 miles. Even when I was driving through Yorba Linda on a

different trip, the Placentia station was in and out block by block, being covered either by 91-X from the south or by the Running Springs station, which has the distinct advantage of being up in the mountains. This same staion came in quite clearly in the Irvine area, even though it is more than 60 miles away and the one in Placentia is only 10 miles away at most. Perhaps if it had been the smae religious broadcast (or same alternative rock music) on each of the low powered staions, it might not have been as noticable or as chaotic, but that is not the case - these were separte and competeing broadcasts.

So, putting aside my bias that I am disappointed to be losing my ability to listen to a distant FM radio station I like, I'm not sure how beneficial having all these overlapping low power stations is going to be. We have a lot of hills and mountains around this region, and so it doesn't surprise me that signals were bouncing in and out as they were while I was driving. I can see how these stations will have their specific applications, such as at a school campus which is a small, fixed location. But otherwise, how are these staions suppossed to reach and hold an audience if one side of the street is hearing one staion and the other side of the street is hearing the other?

Mike

PS - Speaking of 740 AM, I actually have that as one of my programmed AM stations in the car so I can listen to KCBS in San Francisco at night for the CBS hourly news if KNX in LA has something else on preempting the hourly network news. But then, I have been a DXer since I was a kid of under 9 years when I acheived my goal of tape recording the call signs of every AM clear channel station (that I could get out here in LA) from 540 to 1600. I still have that tape. I moved on to the international stuff on other bands when I was a teen. Ah, memories! :-)

Wrong!

The NG of alt.parg was started for members of Phantom't Amateur Radio Group, International
for distribution of information prior to the PARG mailing list starting. It was NOT
started as a place for you to harass & cause trouble.

That 8v was because there was no load on the P/S.
Try running it to a small bulb or resistor then measure the voltage.
Thats the way these things are made. Cheap regulators that depend on a
load.

I have an Optoelectronics R11 Nearfield Receiver for sale. It is capable of sweeping 30MHz to 2GHz in less than one second and locking on and demodulating the signal through the build in speaker. The unit is in excellent condition and includes a carrying case, battery charger and TA-100S antenna. You can lean more about this unit on the Optoelectronis web page .
http://www.optoelectronics.com/r11.htm

Asking $210 including shipping to your door anywhere in CONUS

it's all possible, but just remember. You're heating a lot of stuff
when you turn that klystron on. You're also going to have to provide
the 700 to 1000 watts of power that unit requires to operate.

The cop is going to figure it out when you buzz past him and he sees
sparks all over the car. He's NOT going to be happy when he finds out
what you're up to.

>sesitivity where I connect the splitter?

Are you planning to connect two different radios to these feedlines, or are
you talking about using one radio in two different locations?

If one radio then the splitter will work fine although it will introduce a
3dB signal loss.

If two radios then you may want to scratch the splitter idea and get a
multicoupler. A simple splitter will allow internally generated signals from
one reciever to interfere with the other. A multicoupler isololates each
receiver connected to it so this interference isn't a problem.

Of course, the multicoupler will still introduce the same 3dB loss as the
splitter, but you can find "active" multicouplers which boost the signal
before splitting it so there is no net signal loss.

The downside: such doo-dads are more expensive than simple splitters.
And active multicouplers may actually introduce some interference from
overloading the RF front end of your scanner.

For a good selection of multicouplers check out Stridsberg Engineering:

Hi Marshall,

Band reject filters that need to cover a wide percentage of its center frequency
can be very difficult to realize. The FM broadcast band can be done (we make an
excellent filter for this) but going wider requires more complexity (and the
possibility of unwanted resonances in the passband). In addition, because CH7 for
instance is adjacent to popular VHF HI frequencies- there will be unwanted
atenuation on the skirts of the filter.
You are much better off to identify the offenders and have individual notch filters
built for these channels.
You might also note that it may not be necessary to attenuate all the offenders. IM
is normally third order, and geting rid of any 1 of the offenders in the 3rd order

IM equation will eliminate the problem. A perfect example is pager IM causing interference to the 2M amateur band. Here Fim=F1+F2-F3; select F1=152, F2=153 and F3=158 (all approximate pager freqs) Fim=152+153-158=147 MHz. Eliminate F1, or F2, or F3 and the IM disappears.

Hope this helps.

Hmmm... well the worst interference is coming from the video carrier of channel 5. I get this obnoxious buzzing all over VHF Hi-band. I confirmed the source of the interference by carefully listening to changes in the character of the buzzing while viewing each local TV channel. When I got to channel 5 I noticed that the changes in the buzzing sounds were synchronized with changes in the image on the screen (i.e. fading to black, alternating light and dark scenes all produced distinctive changes in the buzzing sound). My ears are still bleeding from this tedious experience!

I think that television video carriers are something like 6 MHz wide. Given this information are we talking about an extra wide notch filter or a fairly narrow band-reject filter? Has PAR manufactered any filters like this in the past?

What I'm experiencing here may not actually be intermod; I don't really hear any mixing of multiple signals. It's hard to tell for sure with the video carriers, but I'm sure of this when listening to the interference I get from audio carriers. I think it may just be simple front end overloading.

>lots of problems in the past.

Do you happen to know what the insertion loss of these 5KV filters is outside of the notched segment? I'm concerned with how well they perform in the 860 MHz region. I went to the Microwave Filter Company website, but I didn't find this specific information. However, I did see that they had a catalog available, so I think I'll order that.

One thing I noticed was that they had a tunable cavity type filter that you can order with BNC connectors. It's their 6837 series, and they allow you to vary the notch frequency and the 3dB bandwidth with two independant controls. They sound pretty slick, and I like the idea of being able to re-tune the filter should I ever move to another location where a different TV channel gives me grief. Do you have any experience with these?

Thanks for the help!

I just got mine from Lentini for $199.95 shipped. I also got a sma/bnc
adapter
from them for about $4. Also ordered 8 NiMH 1600's for $3 each. They had
everything in stock. Grove has the R2 for $189 but didn't have the adapters.
It's a lot of radio for the money. It will hear almost anything your little
heart desires.
The 25 pairs of search freqs is great. Actually I use it mostly for
searching not
much for scanning. Scanning is only 10 cps. Searching is 30 steps ps.

My guess would be that there is not a great deal of activity in that range. (not around here anyway) so your 245xlt , a triple conversion scanner receives exactly that. Not much. Your 700A on the other hand is receiving so much because it is a double conversion scanner and is actually receiving cell images that are in the 869 to 896 area (not sure of the exact freqs off hand)

Why not the Yaesu VR-500? It covers the same freq range (goes down to
100KHz vice 500KHz, however) yet has 1000 memory locations for scanning
(1091 total with all the band-edge stuff, etc). Pretty much the same size.
It also includes USB, LSB and CW and has a "band scope" (not really a
spectrum analyzer, but similar concept). Uses a BNC connector, no adapter
necessary. Programmable with Windows software and connecting cable you can
buy NOW (ICOM is notorious for not providing the software for their
"programmable" radios, IC-2710H owners will attest to this!).

I just like the little radio. Small package for what it does.

The system is already in operation in parts of the state. What they are
doing is building independant trunked systems in various regions of the
state, with links between them. The entire system is Moto Type II, and
is active in the Indianapolis, Terre Haute, and others.

The 5KV series are very narrow notches 30dB down is less than 1 MHz wide. Upper passband is rated at 450 MHz.

Of course you could create a inverted phase loop between the main deflector dish and a series of neutron explosions, concentrate it off a nearby planet, beam in directly into the sampler port.

>Then how would the base punch through the carrier from his own car ?

Lets say the car is the "open mike". You have to remember, the HT is not receiving the car directly, but through a repeater miles away. So, the transmission from the cars stuck mike is NOT swumping the HT's radio. The HT's radio still will be able to pick up a transmission from dispatch.

The above only would hold true if your police department is using a repeater which most are in the 150MHz range.

Also, (at least here in Lancaster PA) most of the stuck mikes are from the HT's being used. So, if we have a group of 10-15 police standing around during a shooting (which happens every night here in Lancaster!) and one of the officers has an open mike, dispatch will make an "open mike" announcement in hopes other officers hear the call and start asking their buddies to check their mikes.

Open mikes happen several times a day here in Lancaster.

>monitor because they had a cell tower in their house. is this possible?

Probably not as most baby monitors are 46 or 49MHz. Which would be too many "images" away to receive Cell calls, even with a tower in the back yard. Now if you have a device which monitors MilAir you have a much better chance of an image falling in the area.

Ed,

Using an external AC adapter, rather than the internal power supply, greatly reduces the heat generation inside the 2006. The idea is to extend the life of the components. I use four with my 2004's and 2006's.

>
>
On my Pro2004 the unit ran 20 degrees (F) hotter when powered by
the built in AC power supply rather than an external 12V.
Heat kills electronics. More heat kills it faster.
I actually run all my "12V" gear on 13.68V, the suggested "float"
voltage for lead acid gell cellls. I bought a bunch of 2 amp magnetic
circuit breakers [$1 each at a surplus house] and have each device
on its' own breaker. Makes trouble shooting real easy.
The power supply (and old VHF Engineering 12V@20A beast) has a added relay
on the DC out to disconnnect the power supply if the AC mains go down,
{like last weekend when a drunk drove through a power pole!} so the back up
battereies do not drain back through the power supply. When the lights go out,
all the radio gears stays on. I have a 12V@20Amp hour gell cell and can coast
through normal outages with out doing anything. Normal for us is about 2
hours.

I'm looking for an all-band scanner antenna for my car.
I would like to hear from people as to what they can suggest,
any experiences,etc.

Thanks

2792. Band-reject filter for TV?

Newsgroup: rec.radio.scanner
Date: 2000-01-26 00:00:00 UTC
From: blythedevnull@ntrnet.net
Message-ID: <86mqn9$id6$1@netra-news.ntrnet.net>
Source record: 95291

I am looking for an RF filter that will surpress all television carrier frequencies. Ideally it should attenuate both audio and video carriers on the VHF and UHF television bands. There should be minimal insertion loss in the passbands, and the upper passband should have a limit of no lower then 950 MHz. It should also come fitted with BNC connectors

Does anyone know of such a device?

I live in a rather hostile RF environment, and I have problems with intermod and overloading from various television stations affecting both my BC-895 and my PRO-2006. I have identified the specific channels causing the interference, and my first thought was to look for filters for these specific channels. But now I would rather have a single band-reject filter which attenuates ALL television frequencies. This would be a more general solution which could come in handy should I ever move to another location or get another receiver which has different interference characteristics.

I've seen band-reject filters for the FM broadcast band. Surely someone makes a similar filter for television frequencies. If not, why not? Would they be prohibitively expensive? I can't be the only person to ever have this problem. I've suffered through varying degrees of this type of interference for years now. Please tell me there is a solution short of taking up stamp collecting.

Thanks!

What's an MCP2000? European version?

I have two MCS2000 Model I Smartzone 900Mhz and they are VERY similar to the
MTS2000 portable that I have. The MCS2000 is a MOBILE.
My company has five of them and we were one of the first places to get them.
Serials are less than 200. They were major buggy and had to be 'upgraded'
several times by Motorola before getting them fixed. They are VERY good
now.
Nice radio all around, but I like the Spectra series better. Too bad
Motorola orphaned that line.

Bill,

I read the review(s) on the URLs, thanks for the posting . After reading them, I would still have purchased the VR-500! Yeah, I miss the memory channel lockout, so useful in my BC2500XLT. But the one thing I absolutely could barely tolerate in the '2500 was the limitation of NFM/WFM/AM modes only. Sorry, folks, I like my CW (SSB? can take it or leave it, most times leave it).

The VR-500's memory channels are full of FM frequencies. Amateur repeater outputs, railroad freqs, etc. Love to take it to the mall, particularly around Christmas, and scan the FRS frequencies (this hasn't been made "illegal" yet, has it?).

But, being able to copy CW from such a tiny radio boggles my mind.

Well going from a 800mah battery pack to a 600mah pack is not exactly a "step forward". With the 600mah pack you will get less use of the scanner since it will have less battery capacity. You need to look for a battery pack with a equal or greater mah rating than the one you have. I have purchased several high capacity battery packs from Primecell and have been happy with what I got. http://users.aol.com/primecell/custom.html

Determine if it's an "AC" hum caused by a filtering problem
in the power supply stage by powering your scanner from an external,
well filtered 12 VDC power supply or (better) car battery.

If the hum disappears while running the scanner on a car battery,
you may have to replace the main filter capacitor, which is
usually the largest electrolytic cap in the radio.

2817. Kenwood R1000, R2000 & Icom ICR100?

Newsgroup: rec.radio.scanner
Date: 2000-01-27 00:00:00 UTC
From: rsmtmn@aol.com
Message-ID: <20000126200657.13146.00000120@ng-cj1.aol.com>
Source record: 95233

Does anyone know what a used Kenwood R-1000, Kenwood R-2000 and a Icom IC-R100 is worth? I have the service manuals for both for the Kenwoods, and all of the radios are in very nice condition, owned by a non-smoker.

Let me know.
Thanks.
Dan

With the base named SECTOR, it's gotta be Customs-
they're the only one I've ever heard using that name...

Here's some info on the VR-500.
http://www.strongsignals.net/htm/vr-500.htm
http://www.strongsignals.net/htm/revvr500.htm

There's no memory channel lockout. Sounds like a real bummer. Here's some
other things too.
It boggles my mind the ways manufacturers will omit some features on
potentially excellent radios.

Things I Would Change - by Rich Wells

Extremely poor 800+ MHz filtering
No memory channel lockout
Accelerated tuning for rotary control
20 banks would be sweet
MANUAL setting for Lamp Mode
Have search bands store step and mode
Faster scan/search wouldn't hurt
CTCSS/DCS would be AWFULLY nice
Per channel attenuation and RF squelch
Metal belt clip
Allow FUNC to be pressed instead of having to hold down to use

Bill K9KZ

I know in Redding, Ca they used to operate on a two channel system (transmit frequency for base and separate x-mit for car). They were something like 152.360 and 153.25. Anywyas, if you scan that range, you will hit on something. Unless they have changed systems down there.

Agree.

I have just bought an R2 - a little idiosyncratic to set up (some good software around, which REALLY helps), have an R10 also, but the R2 is very handy. You can almost use it one hand!

That's a good idea, put a nice big reflector on the front of your vehicle so that more power is returned to the radar receiver at a longer range. They will have a tracking history on you for about a mile and there will be no doubt about the idenity of the violator.

That is akin to making your Geo look like a semi. You should apply for a patent. You are obviously a genius to have figured out such a complicated jamming technique.

I have an Optoelectronics R11 Nearfield Receiver for sale. It is capable of sweeping 30MHz to 2GHz in less than one second and locking on and demodulating the signal through the build in speaker. The unit is in excellent condition and includes a carrying case, battery charger and TA-100S antenna. You can lean more about this unit on the Optoelectronics web page .
http://www.optoelectronics.com/r11.htm

Asking $200 including shipping to your door anywhere in CONUS

I would also consider a trade for a laptop computer.

Plenty of people unfortunately don't understand or can't articulate
the difference between cellular and cordless phones.

Baby monitors do share a few frequencies in common with OLDER 46/49 mhz
CORDLESS phones. It certainly is possible to pick up cordless calls
via a baby monitor.

With a cell tower right next to your house, if the baby monitor had a
cheap front end ($8 KMART receivers have a tendency to have shitty
front ends), it could be overloaded by the high power of the cell tower,
DESPITE what frequencies are involved.

I have noticed trunking type data channels assigned to different area State Police Posts; However, I hadn't detected any traffic. The part I've been the most curious about, there are a few counties that have just purchased new EDACTS systems. I have been wondering how different agencies can communicate with each other across different trunking systems (& frequencies), and their own, at the same time. I suppose its a matter of the receiver reading the unit ID.

Bill,

You can configure the VR-500 to scan whatever channels and
banks you want. It's more flexible than the IC-R2 in this regard.
The VR-500's scheme merely "locks in" a channel instead of "lockout."

See my VR-500 review in the current issue of Monitoring Times (Feb
2000).

: Anyone know anything about this radio ? Motorola MCS2000
:

It is the handheld version of the series of 800 Mhz trunked radios.
The unit is about $1650 each for Model II (alphanumeric display
and keypad). Model I is cheaper (about $900) with less features.
Very flexable radio for trunking.

The MCP2000 is the mobile unit.

Got one to sell?

BTW, this is becoming the standard radio for police and public
safety.

> > enthausists and not some lower class citizens.

My disdain and disgust with CBers (as opposed to those who simply try in vain to use the CB band) has nothing to do with losing 11 meters from the ham bands.

It has everything to do with the cesspool that CBers have made of 11 meters. It has everything to do with us almost losing the legal right to utilize full power on 10 meters because the criminal scumbag CBers insisted on perverting (as they pervert pretty much anything they do) our linears to their criminal use.

> Eventually the "old"
> > folks will become SK's and we can once again get into sharing the
fun of

My my my, such hateful venom, wishing death on people who rightly disagree with you about your saintly CBers.

> Unfortunately I think the latest thing will be..."I'm a real ham
> > because I had to learn code...."

Well, for all the whiners wish otherwise that is the case. Any no-coders and those with licenses General and above post April 15, 2000 simply are and will be inferior. But as inferior as they might be they are nowhere near as inferior as the whining cheaters who abused the ill-conceived and ridiculous 'disability waiver' program which was

nothing but a cheat route for lazy whiners and a general insult to any and all disabled persons, especially those who DID pass the requirements legitimately on their own merits.

Really. To kill one of those you'd need something like a 500 kW TWT tuned
to the proper frequency - oh and it would also tend to cook whoever was
holding the radar gun. All the foil can do is increase your radar
cross-section and give the officer a nice clean reading of your speed.

I have a BC245XLT and I was looking to purchase another batter pack. The stock battery is a 4.8V DV wtih 800mAh, Uniden part number BP-180. I have located a retailer selling a battery pack which is "designed to fit the BC220,230,
235, and 245." The part number of the battery pack for sale is Uniden part number BP-120 which is 4.8V DC with 600mAh. Will this battery work properly in the BC245XLT given the differences (800mAh vs. 600mAh)? What, if any, would be the effects of this battery on the performance of the scanner?

Source record: 95129

Dave,
Sorry no manual, but:
Simply use the L/O button to lock out the channels you don't want to scan. Press MANUAL, press the number(s) for the channel you want to lockout, press MANUAL again, confirm you've got the right channel and press L/O. "L/O" will appear in the display under the channel number. You can't remove a frequency from memory unless you do a reset, which clears all the channels. (Or enter a new freq. for that channel.)

When you select the priority function, "PRI" appears in the lower left corner of the display, and the scanner will check the priority channels on all active banks. The priority channels is the first channel in each bank, eg: Ch. 1, Ch. 11, Ch. 21, Ch. 31, etc.

Hope this helps,

"VERY good" compared to what ? A Kenwood ? The MCS2000 is a flimsy piece
of plastic junk ! Unfortunately it reflects the attitude of the new group
in charge at Motorola - put out cheap, poorly thought out low cost, low
end junk to compete with the proliferation of inexpensive mobiles put out
by other companies.

> Nice radio all around, but I like the Spectra series better. Too bad
> Motorola orphaned that line.

Well, not really, the Astro Spectras have picked up the torch. Also
I believe the regular analog Spectras are still available on a 'per
customer' basis. (ie. if you yell loudly enough, you can get one).

> > BTW, this is becoming the standard radio for police and public
> > safety.

AHAHAHAHAHAHA....you wish ! it's a piece of shit radio, the only
agencies that are buying into them are the ones that can't afford
Spectra's !

Anyone that thinks a 110 watt A-9 Spectra with INTEGRATED siren
packages, INTEGRATED vip capabilities, and Astro IMBE capability
is inferior to a flimsy piece of plastic, that uses all kinds of
hideous add on kluges to achieve the same things a Spectra does,
is smoking crack ! Also let's see an MCS2000 do OTAR, it ain't
happening !

It's a junky piece of shit ! If you have a say in it, insist on
a Spectra !

LONG LIVE SPECTRA/ASTRO SPECTRA !!!

Yes, it will work, but if you will notice the mAh rating is less on
the second one you mentioned.

The lower the mAh rating, the less amount of time the battery power
will last before needing a recharge.

To simplify it, lets say your scanner draws a CONSTANT 1 amp per hour
(this is not the case, only using it to make the explanation easier to
understand). If your battery has a 600 mAh rating (converted .6 Ah)
you battery would essentially last .6 hours. With the 800 mAh battery
(converted .8 Ah) your battery would last .8 hours.

So, the higher the mAh rating, the longer the batteries last. But to
figure exactly how long it will last for you is nearly impossible.
You can only estimate. The radio draws less power when it is just
sitting on one freq with no audio being received. It draws a little
more when scanning and no audio being received. It draws even more
when you are receiving audio, and how much depends on how loud you
have the volume set, and how loud the source audio is.

I hope this made it a little easier for you to understand.

Bill

FOR SALE

Yaesu FT50R Dual Band Amateur Radio Handie Talkie

FTT-12 keypad board with CTCSS/DCS decode and Digital Voice Recorder
ADMS-1C programming software & cable
CT-30 microphone adapter
2 FNB-47xh 7.2v/1800mAh NiMH batteries with hd spring belt clips
NC-60B wall charger
W & W Asso. rapid charger
Has MARS/CAP mod performed by pro technician

Radio and all items work well & are in good condition.
Price is $275 shipped to lower 48, prepaid with USPS money order.

Contact Phil @ miksky@execpc.com

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, the deluxe report | includes an extra index sorted by frequency and a custom | frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496. |

You may be able to obtain manuals for older Midland scanners | from: |

Midland Consumer Radio Products |
1670, North Topping, |
Kansas City, |
MO: 64120 |

Phone: 816-241-8500 |

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, the deluxe report | includes and extra index sorted by frequency and a custom | frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information

is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the

channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75

recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel

pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found

during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my

shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855. email rlassoc@inav.net

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model	UHF	VHF-high	VHF-low
SM-301	X	X	X
SM-302	X	X	
SM-303	X	X	
SM-304	X	X	

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel

Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications
Corp. sells used Plectron receivers, in working condition,
for $75-100. If you require crystals or reeds, TCS may be
able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like"
signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and
ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated January 27, 2000 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, Tom Harker, and ARRL for providing some of the information.

JANUARY 2000

Jan 2 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Jan 9 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

Jan 23 (Sun): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jan 23 (Sun): Cicero, IL - Wheaton Community Radio Amateurs Mid Winter Hamfest - 2000 at the Chicago Motor Speedway. 3301 S. Laramie, Cicero. Located between Central and Cicero, between the Ike and the Stevenson. Tickets $5.00 in advance with 4 stubs. Free parking. Talk in on 145.39 (-.600) 107.2 or 103.4 Hz PL and 444.475 (+5.0) 114.8 Hz PL. Info: www.w9ccu.org or send email to hamfest2k@hotmail.com.

Jan 23 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

Jan 30 (Sun): Orland Park, IL - Giant Computer Show & Sale (see below). Orland Park Civic Center, 147th St. & Lagrange Rd. 9:30 AM - 3 PM. Adults $6, children $2.

FEBRUARY 2000

Feb 6 (Sun): Wheaton, IL - Giant Computer Show & Sale (see | below). DuPage County Fairgrounds, County Farm Rd. & Man- | chester Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Feb 13 (Sun): Orland Park, IL - Giant Computer Show & Sale | (see below). Orland Park Civic Center, 147th St. & Lagrange | Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Feb 26 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Feb 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

MARCH 2000

March 19 (Sun): Sterling, IL - Sterling-Rock Falls ARS. info: Lloyd Sherman, KB9APW, PO Box 521, Sterling, IL 61081-0521. tel. 815-336-2434, E-mail: lsherman@essexl.com

Mar 25 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

March 26 (Sun): Grayslake, IL - Lake County Fairgrounds. North Shore Radio Club. http://www.ns9rc.org. ALL INDOOR, Radio, Electronic and Computer Swapfest V.E. Testing 9AM to Noon, Door Prize Drawing Every Hour, Admission $6 at the gate / $5 in Advance. Door Open at 8 AM. Set-up at 6AM. Free Parking. Cafeteria Open. Talk-in Simplex 146.52 & NS9RC Repeater 147.345 +.600. For NS9RCfest Information Call (847) 291-4160 until 10 PM. Info: Jacob Fishman, KF9ZF, PO Box 1066, Highland Park, IL 60035. Phone: 847-291-4160, Email: kf9zf@lightwriters.com

APRIL 2000

Apr 15 (Sun): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Apr 29 (Sat): Stickney, IL - DuPage ARC. http://www.w9dup.org, Info: Ed Weinstein, WD9AYR, 7511 Walnut Avenue, Woodridge, IL 60517. Phone: 630-985-9256. Email: DARCHamfest@aol.com

Apr 30 (Sun): Arthur, IL - Moultrie ARK. Info: Ralph Zancha, WC9V, PO Box 55, Lovington, IL 61937. Phone: 217-873-5287. Email: rzancha@one-eleven.net

Apr 30 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

MAY 2000

May 20 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

May 28 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JUNE 2000

Jun 4 (Sun): Princeton - IL Starved Rock RC. Bureau County Fairgrounds. Exit 56 from I-80. Admission $7 (ouch!) at gate. Talk-in 146.955, -600, PL103.5 Hz. info: AL Erbrederis, tel. 1-815-498-9675, 262 Easy St., Somanauk IL.60552. ERB.N9PIB@juno.com. http://www.qsl.net/w9mks. E-mail: w9mks@qsl.net. (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 11 (Sun): Wheaton, IL - Six Meter Club of Chicago. http://cyberconnect.com/orion/smcc.html. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Avenue, Downers Grove, IL 60516-3925. Tel: 630-963-4922 or 708-442-4961 . Email: wa9rij@mc.net

Jun 24 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jun 25 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JULY 2000

Jul 9 (Sun): Peotone, IL - Kankakee Area Radio Society, http://www.w9az.com. Info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. Tel: 815-939-7548. Email: k9nr@juno.com

Jul 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jul 23 (Sun): Sugar Grove, IL - Fox River Radio League. Waubonsee Community College. http://www.frrl.org/hamfest.html Info: Maurice Schietecatte, W9CEO, 813 Cindy Lane, Sandwich, IL 60548. Tel: 815-786-2860. Email: w9ceo@arrl.net (good, small to midsized ham-

fest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. http://www.w9uvi.org. Info: Jim Williams, N9HHU, PO Box 3508, Peoria, IL 61612-3508. Tel: 309-692-3378. Email: jimn9hhu@juno.com

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. http://www.chicagofmclub.org. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best ham-

fest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30

AM to 3:00 PM. This show features computers, supplies,
games, parts, software, accessories, CD-ROM, monitors,
diskettes, printers, keyboards, modems, disk drives, cables,
expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the
RCMA Newsletter, December 1988. It may not be reproduced
in whole or in part on CDROMS, in bulletin boards,
networks, or publications which charge for service without
permission of the author. It is posted twice monthly on
the USENET groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is
difficult to use because of too much hysteresis. The
American Heritage Dictionary of the English Language
defines hysteresis as the:

o "Failure of a property changed by an external agent
to return to its original value when the cause of the
change is removed."

It's like having play in a car's steering wheel, or
backlash in a gear set. Too much hysteresis in a squelch
circuit forces one to keep the squelch at a tighter
setting, missing weaker signals when scanning or searching.
The squelch hysteresis problem was first addressed in a
1984 article about the Radio Shack PRO-24 crystal
controlled scanner.

Why do engineers design these circuits with any hysteresis?
Basically, hysteresis prevents weak signals from "popping"
the squelch open and closed rapidly, which would be very
annoying to the listener. A squelch circuit with hysteresis
requires a stronger signal to open the squelch than it does
to keep it open.

Models cursed with too much hysteresis include the
Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003,
PRO-2004, and others. Don't despair, the fix is simple for
most radios. I've successfully reduced the squelch
hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,

archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or | through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) | phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://dune.globe-net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than 70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor receivers of various brands in my collection. This article describes a few of the FM receivers in my collection, and other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters
Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)

Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very

good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10

temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring

Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by

reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service

Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in

the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very

fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique

frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base

versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked

out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken

around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet

available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are

provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-

channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are

unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit

diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, the deluxe report | includes and extra index sorted by frequency and a custom | frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Does anyone know if OSP still uses the vehicle extenders? These were popular a few years back but since Uniden came out with the Beartrackers, which monitors these transmitters, I have not been able to find this listing in POLICE CALL. OSP used to use old low band and uhf portables on their collars as extenders. I know the freqs on mobile car radios but need the Portable freqs as described. Please reply to
SSPNELSON@aol.com

2916. AOR 3000 reset

I have an AOR 3000 that's lost its mind. I forget the exact symptoms, but it tends to ignore keys, displays strange data on the screen, or some such. Is there a master processor reset procedure for this thing?

Thanks,

Having trouble locating a downloadable manual for the 9000 online. Does anyone know a website that has it? Thanks very much.

Wabbaloo

2918. Pro-94 Priority Group IDs

Newsgroup: rec.radio.scanner
Date: 2000-01-28 00:00:00 UTC
From: gwheeler@vmguys.com
Message-ID: <86t0j0$p6d$1@nnrp1.deja.com>
Source record: 95156

The Pro-94 scanner seems to have a deficiency in the way it uses priority channels. Consider the following scenario...

The scanner has a trunked system programmed (in my case it is an EDACS system). You have entered a list of group IDs you like to listen to, and one or more of them is marked as a priority channel. (This is all described in the manual on pages 53 to 55.)

Now, set the scanner in trunked mode, press the Scan button to scan your list of group IDs, press the Delay button to enable delay mode, and press the Priority button to enable the priority channels.

Here's what happens:

If the system is idle for a time, you'll see the words "Id Scan" scrolling on the display. At that time the scanner is tuned to the control channel, watching for activity on one of the group IDs you have in your list. If you look at the little dots that represent active channels, you may see activity that you're not hearing. Those transmissions belong to group IDs you don't have in your list.

When there is a transmission for an ID that is in your list, the scanner immediately tunes to the appropriate channel to listen. The display shows the group ID in use. During the transmission you'll see only two channel indicator dots: a flashing dot shows the channel you're listening to, and the other dot is the control channel. Since the scanner is not tuned to the control channel, it cannot indicate what other channels may be in use because it doesn't know.

When the transmission ends (i.e. when the sender releases the PTT button), the scanner tunes back to the control channel. The display continues to indicate the group ID you were listening to for 5 seconds (the delay period), but you can tell the scanner is on the control channel because the channel use dots show all channels that are in use.

This is where I think the priority channel operation could have been improved. While the scanner is tuned to the control channel, it *should* watch for activity on any group IDs that are marked as priority IDs in your list. If any is seen, the scanner should tune to the priority group ID immediately. However, what actually happens is that the scanner watches only for more activity on the group ID currently being displayed. Only after the 5 second delay with no activity will the scanner tune to any other group ID.

So, this brings me to my point: Has anyone found a way to get a priority group ID to "break into" a non-priority ID? It seems to me that is the whole point of marking an ID as being a priority. What mode (priority,

scan, delay, etc.) do most people use for casual listening?

Sorry to be so long-winded. Thanks for any tips.

Gerry

I recently did a discrminator tap to may scanner but I cannot decode
MDT....
I plug the tap into my line in on my computer and i can hear the audio
from the scanner.
The MDT program says monitering but never does anything. Im pretty sure
I did the mod properly
I have another scanner w/ out a discrinator tap and when I plug the
headphone jack into
the audio in jack on my computer than using the mdt program I click on
analyze signal i see something like

```
__
|___| |___ but when I do it w/ the desrminator tap I see
_ _
```

something like that but more | |_| | closer together so im
pretty sure I did the mod right but i don't know why the program won't
work.
Someone told me I need to add a tantalum capacitor....would that help/
how would i add it?

>cross-section and give the officer a nice clean reading of your speed.
>

I have resisted adding to this flamewar.
But I have seen OLDER Kustom TR6 X-Band police radar get fried by a 40 meter, 200 watt, mobile ham rig. Mr Policman was running his radar in a parking lot over looking the local "speedway" and a mutual ham friend pulled up eside him and when Mr. Ham responded to a call the cop said the radar just went silent.
The detector/mixer diode got popped. The designers screwed up and did not include enough bypass for lower HF. The small town police department told the policeman to trash it. He gave it to me and I restored it to full operation by replacing the diode.
Another friend has it on a semi-permanent loan and uses the Tx head to "test" radar detectors on the highway.

Latest update to my "LAPD Communications History" page
< http://www.snowcrest.net/marnells/kma367.htm > is an audio recording from the 1997 shootout between LAPD officers and two assault-weapon armed bank robbers wearing full body armor. The officers' weapons were useless against them, and many officers and civilians were wounded during the exchanges. If you haven't heard it on the net before, it should grab your attention. Note, it's a 4 MB .wav file, and may be a bit slow to load...but it's definitely worth it.

Listen at http://www.snowcrest.net/marnells/officer.htm

That is a good page but just lists the freqs and id groups which I already have. The PD uses lots of "codes" like code 5 which I think means lunch time and code 30 which is an emergency. There are many more which I havent figured out yet.

This is easily the most interesting system to listen to in my area, and I would love to learn more......

Thanx anyway,
Stan - K9IUQ

2929. Car Antenna Options

Newsgroup: rec.radio.scanner
Date: 2000-01-28 00:00:00 UTC
From: csf@duke.edu
Message-ID: <86t7abfad1@news.duke.edu>
Source record: 95167

I'm interested in improving the performance of my Pro-39 scanner in the car. Checking out the options, it looks like I can choose between a traditional magnetic whip antenna, a cellular "look a like" antenna, or a device that converts my car antenna into a scanner antenna. Obviously the latter option would be the most attractive and convenient, but it seems to me that this would be a dramatic compromise in performance. I also like the sound of the "look a like" antenna. Basically, does anybody have any experience or input on any of these options? Also, would a scanner antenna close to a CB antenna produce any interference? Any advice greatly appreciated!

Thanks,

Craig Ferguson

>
There is a reset button inside. Take the bottom off of the case. The
button is on the back side of the keyboard-display circuit board, near
the bottom edge. It is roughly between the zero and decimal point
buttons. There is also a lithium battery on that board.

<snip>

> Well, for all the whiners wish otherwise that is the case. Any
> no-coders and those with licenses General and above post April 15, 2000
> simply are and will be inferior.

I have to disagree. I am one of those who will become a general after
April 15th. I know several general and even extras that know much less
about radios than I do as a technician. I passed the general written with
no problem after a less than a week of study. I took a test exam just to
see where I stood and passed it before I even looked at the study guide.
I am actually in favor of increasing the difficulty of the written test.
The
general was too easy.

Being good at code does not garentee a good amateur operator. Listen
to some of the HF bands. Old timers act like CW is the only thing that
matters in amateur radio. I believe that amateur radio is experimenting
and learning new things. CW has gone as far as it's going to go. As a
technician I have built several antennas, a couple of PSK interfaces, a
crossband repeater interface, several other projects and helped "old timers"
construct towers.

If you are going to required CW, you should also require knowledge of
computers
and imbedded processors which are becoming more and more prevalent
in amateur radio. Times are changing and so should amateur radio. Do you
want to go back to spark gap transmitters?

Well, that's it for my rant.

2939. Discrim tap for 2042, where?

Newsgroup: rec.radio.scanner
Date: 2000-01-28 00:00:00 UTC
From: Chris <spamsucks@nowhere.com>
Message-ID: <86tpam$65j$1@bob.news.rcn.net>
Source record: 95177
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I want to put a discriminator tap on my Pro-2042. I have an Opto 535 installed, and one of the wires goes to a contact labeled TP2, which I surmised was a discriminator tap. I also read someplace else that TP2 was a discriminator tap, but another place mentioned a pin on one of the chips. Does anyone know for sure where to tap the discriminator, and if it is TP2, how to go about hooking both the Opto 535 and discriminator output to it without the two interfering.

If I have to type discrimnator one more time, I'm going to go nuts. BTW, just respond by posting to the newsgroup.

The MCS2000 is also available in the remainder of the bands as
well as 800/900 mhz.
True to Motorola fashion, they build them first and then design
them in the field.

While I won't say they are the best radio to come along, the
MCS2000 is not a bad radio. It still does have a bug in the way it
handles a remote head. The "Big M" supposedly is working on the
firmware fix for this. Also, OTAR is not the highest on the list of
priorities unless you work for the government and even they don't
generally use it.
I firmly believe the Spectra and Astro Spectra may well be the
best units they have brought out in years. They are still available
to government and other law enforcement through Motorola direct.

Why are you bringing a .scanner thread over to the amateur NGs, John?
But since you're here, tell us in what manner you're abiding by the
Amateur Radio Service's charter, as mandated by the FCC:

97.1 Basis and purpose.
The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:
(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.
(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

Tell us about your lastest project. (You do have a soldering iron, right?)
What have you built and operated on the air?

73, Jeff KH6O

If it is the 16 channel one, it is worth up to $50 in great condition. It does get the 800 mhz band. There was an earlier pro-24 that had like 4 crystal channels, you would not want it, unless you have a museum.

Regardless or what this guy writes at the end of the post about his request not being porn (btw, why would he lead these young ladies to believe that these pictures could lead to employment in the adult porn industry if his intentions were purely artisitc?), I'm not real
sure how appropriate it is for 14-16 year old girls to be posing for nude and semi-nude photos. Maybe I'm a little old-fashioned...

Does not bother me.

I have it on ALL the time.

Otherwise you may miss slow responses to answering a previous speech segment.

Did you see the 9000 computer interface mod on the http://www.bander.com
web site.

Due out any time now.out

For every 9000 up for sale, there would be 10 AOR 8200's advertised world wide.

>
> Thanks,
>
> Craig Ferguson

A cellular look alike antenna does look nice. However, its performance is lousy. An AM/FM antenna splitter will not do much better. Your best bet of the options you mentioned is a magnetic mount antenna placed on the center of the roof or trunk. A CB antenna will not give good results. You will need an antenna specifically for scanning. Radio Shack actually has a pretty decent magnetic mount scanner antenna.

2975. Roof (scanner) antennae help.....again, please

Newsgroup: rec.radio.scanner
Date: 2000-01-29 00:00:00 UTC
From: emoney250@aol.com
Message-ID: <20000129035030.25654.00000271@ng-bg1.aol.com>
Source record: 95056

I got the antennae up I ordered from Radio Shack. Nice. I bought a grounding block and grounded the coax as well as the antennae mast itself (as the intructions called for). The problem: I get what I call "pager noise" when my squelch is turned down to the most sensitive setting. I almost have to turn it up all the way to get rid of it. Now when I plug in my stock rubber ducky, like before I get no noise interference on these frequencies. Do I need to repostition some/all of the antennea/ground parts. Do I need to use other than RG-6 cable. Any help from a knowledgeable person would be appreciated. Or do I simply need to deal with the extra noise and/or block out the frequencies I get this noise on?
Thank You
Eric G.

This is a common problem; I'm dealing with a similar situation myself.
What's happening is that your new antenna is providing increased signal
strengths to your scanner for both desried and undesired signals. Powerful
pager transmissions commonly cause interference on a wide range of scanner
hardware. The best scanners have RF circuitry that can stand up to a
barrage of powerful signals while still being able to discern the weaker
ones, but the majority of scanners will inevitably fall down at some point
and "spill their guts". The reason you don't hear this interference with
your rubber ducky is that it simply doesn't provide enough signal to overload
the receiver.

>Do I need
>to repostition some/all of the antennea/ground parts. Do I need to use other
>than RG-6 cable. Any help from a knowledgeable person would be appreciated.
>Or do I simply need to deal with the extra noise and/or block out the
>frequencies I get this noise on?

Repositioning your antenna system will probably not help, and there is nothing
wrong with your cable. It sounds like you need a notch filter to block out
the offending pager signal. PAR makes a variety of notch filters with BNC
connectors that you can insert into your feedline to remove the offending
signal before it gets to your radio. I think they cost around $60.00.
I know that Grove sells them, and they were reviewed in the July 1998
issue of Monitoring Times if you have a copy handy.

But before you purchase a filter you need to know what frequency the pager
transmitter is operating on because it is this frequency that the filter
must remove. In other words, the filter has to be tuned to the frequency
of the pager transmitter. Most pagers operate in the 152, 158, 454, and 462
MHz ranges, but the interference from them can show up virtually anywhere
on your scanner. You need to search through these bands and listen for
powerful transmissions. Do this with your rubber ducky attached; it will
help you track down the true offender instead of the "phantom" signals that
your roof antenna introduces.

Do you have access to a second scanner? If so then you can monitor the
interference on your first scanner (connected to the roof antenna) while
you hunt for the offending signal on the second scanner. This way you can
compare the signals received on both radios to insure that you have
identified the correct one.

Good luck!

Source record: 95058

That's good advice. It is a difficult situation to provide for a noise-free spectrum across the wide frequency range of most modern consumer-grade scanning receivers. These are devices that, typically, have poor image rejection and suffer from severe intermodulation distortion. With many harmonics to deal with, the best that you can hope for is to provide for good reception on the "bands" that interest you most.

A notch filter is the way to go. For a good one be prepared to shell out.

2978. 3.975 LSB ARES/SKYWARN Net

Source record: 95061

We have the Radio Shack scanner antenna mounted on a communications vehicle and it does well. The mobile scanner (a new Radio Shack something-or-the-other) is really cheap! It is almost impossible to listen to any frequency in the city as it suffers from SEVERE distortion across the entire spectrum. It was just about a waste of money. Comared to other devices in the vehicle the RS scanner is junk. So here is what you're up against if you live in a metropolitan area.

Testing the antenna on a few other radios works well (no xmit!). For example, the AOR receiver suffers little from IMD but has a few cellular images on 800 mHz. The Kenwood receiver has NO IMD and NO front end overload whatsoever. So your problem (with a handheld is even worse) will be increased noise and little reception of what you want to hear once you mount an external antenna.

Overall, the antenna shows a good sensitivity to many "bands" and I am pleased with it.

TP2 and TK10420 pin 9 are the same point in the circuit. This si the correct NFM discriminator tap point. Connect TP2 to your cicuit with a 1uF capacitor, + lead to TP2.

Bud, I agree that it's good advice, and so is yours. One thing I would add: among moderate priced scanners it is worth paying the little extra for a triple conversion design, rather than trying to save money with a more inferference-prone double-conversion designs. Side-by-side, the difference I hear in "pager interference" is tremendous.

Good listening,
Charley_Harp@alum.calberkeley.org

'F'amily 'R'adio 'S'ervice, sometimes referred to as "the Citizens' Band of the 90s."

Perhaps you have seen the little radios marketed by Sony, Midland (I think), Kenwood, ICOM, Motorola, and others, that look a little like an amateur-band handheld but the display has only a channel number displayed? Those are the FRS radios. They are very tightly restricted as to manufacture; for example, the antenna, a rubber duckie, cannot be removed (supposedly, I'm sure some enterprising person has figured a way to use an outboard antenna) and the transmitter power is tightly controlled, etc.

It is intended for use by individual family members to keep track of each other in places like malls, amusement parks and/or just around the house.

I'm sure someone in this newsgroup can provide you (and me) with more information.

Turner

Your best best would be to see if you can find an older Twin Cities Scanner List. It was made and distributed by the Minnesota Radio Hobbyists (MRH) group in the Minneapolis / St. Paul area. That was probably the most accurate and upto date lists ever available. Other then that, you can try the web pages, but most of those got their information from out dated and unverified sources, or just plain copied directly from the from the Twin Cities Scanner List...Which, is one of the main reasons the MRH group nolonger distributes it freely to the public, but yet still maintains an upto date list for its members. Its too bad...
Also, try a Police Call Directory. Some of the members of the MRH group still help out with the Minnesota frequencies, and the labeling of information in that publication.

Good Monitoring.

>There's about 2-3 db of IL outside the notch. I had some of the 5KV's retuned to
>so that it notched out a particular paging channel with the notch so that it
>protected an desired 154MHz FD channel.

It looks like they have filters pre-tuned to TV channel 5, so that's
what I need.

>Get a copy of their FastTrap catalog. It has all kinds of info on their line of
>filters for scanner use, while designed for CATV they work quite well and are
>far less $$$ than their RF capable counterparts.

Yup, that's the one I ordered!

>No, they are too $$$ for scanner use in my opinion, they start at about $200 for
>a single cavity notch.

Yikes! Well, I think I could probably get along with the cheaper CATV
filters ;-)

Thanks so much for the advice!

Go for it. I've done what you suggested. I've used regular Nextell NiMh batteries from Bill's 2 Way with the nipple on the positive end. The nipple makes the batteries a little long and hence hard to get in and out of the scanner (ended up soldering on the side of the nipples to increase clearance - not the top). Best to use the flat end batteries and the metal tag connectors.

At first I used wire to solder the batteries together, but the wire broke with movement. Better to use solder wick braid to connect the four batteries together (metal tag connectors on flat end batteries would be best).

You can get the connector plug and wires by going to Radio Shack and getting permission to take Nicad batteries from the recycle bin - I got a whole load of connectors that way.

Cheers Karl

I got a plectron receiver. I am not sure what model it is, but below I have listed the info on the unit. I would like to see if I can have it retuned to alert for my Department. The two tone boards inside are part # 058-08817-000 and are set for 701 and 1743. I would need 2164 and 1232. I would also like to get a second crystal for 46.20mhz. It is a two frequency unit, with the second slot open (on 46.10 now).
I also need it to alert for both Long B and A-B combo. Can it do that? Adjustable??
Please let me know if you can help or know of someone who can.
code: 701-1743
Sr # R8190B1-12644
freq: 46.10.

That's cute, Bryan. By the way, I'll be glad (if the day comes within MY lifetime) to see programmed robots playing football or some similar sport. IF such an activity could become the
megabusiness that NFL football is today (never say never), I'd celebrate the passage of rewarding
intellectual idiots (including owners) with the megabucks that they certainly do NOT deserve, in my
conceited estimation. I used to feel quite differently.... that the players got what they deserved,
that the fans deserved to pay through the nose for tickets, that the owners were merely shelling out
a percentage for salaries, etc., bla, bla, yada, yada. But, it has gotten totally absurd. I read
where Juan Gonzalez for the Rangers has been offered an 8 year 140 million dollar contract to switch
to a Tiger uniform. It has become soberingly apparent to me that this has gone to the point of
lunacy. No more will I shell out big bucks to fight traffic and build frustration. Life is too
fucking short for such self abuse.

Try going to http://neon.polkaroo.net/~darkwing/tafl. Using "labrador city" in the Newfoundland file came up with lots, as did "wabush." For Baie-Comeau both "baie-comeau" and "baie comeau" had hits in the Quebec City Region file.

>Does anyone know when the US is going to stop putting the error in GPS
>Like they said they were going to do a long time ago?

They said they would examine the need for Selective Availability (the error you are talking about) and remove it within ten years. This statement was made in 1996, so you may have to wait until 2006.

What is your application, anyway? For many people it won't make a difference. For large-area navigation (aircraft enroute nav, figuring out where you are on a highway) the existing system's 100 m error (which in practice turns out to be under 50 m most of the time) is plenty of accuracy.

On the other hand, if you're trying to avoid rocks in a narrow channel with a boat, you need differential GPS today, and you'll still need it after SA goes away. Even with SA removed, other natural sources of error mean that accuracy will probably only be 15-25 m or so, not good enough for the boat avoiding the rock.

If you're in Dallas, Tanner's has four AA Nicads (850 mah) already in
the configuration for the battery pack. All you need to do is add the
connector (I salvage a handful every so often from the recycle boxes
at R$ or Batteries Plus). For $1.25 each pack, that's a pretty
inexpensive way to get a backup battery pack (or two or three).

On some I've used liquid electrical tape on others I've purchased a
few feet of the shring wrap from my local batteries Plus.

Hope that helps...

>Is there any reason why I could not buy four "AA" NiMH high capacity cells,
>solder some tabs between them and shrinkwrap the whole deal? It'd be a lot
>cheaper than buying a 'manufactured' battery pack.

A well designed splitter will show excellent port-port isolation- usually in
excess of 20 dB. Even the TV splitters that are rated for V/U show 20 dB port to
port- with 50 or 75 Ohm cable.
It makes absolutely no differnce where you mount the splitter- however, RG58 really
is not suitable for UHF even with reasonable line lengths. Remember, the cable loss
and splitter loss have the mathematical effect of adding directly to the system
noise figure.

But wouldn't that be "divulging?" Or would it be similar to turning up the volume on your scanner and attaching zillion-watt loudspeakers (exaggeration for effect)?

Nope. Blake doesn't post to the amateur NGs; it began in .scanner,
and you cross-posted it to .misc to widen the audience.

But since you're here, tell us how you're abiding by the Amateur
Radio Service's charter, as outlined by our government:

97.1 Basis and purpose.
The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:
(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communication service, particularly with respect to providing emergency communications.
(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

Be specific now.

MASSIVE SNIP of stupid Glann rambling.

So what is your point?

> > I have never impersonated an FCC official
>
> You said you were appointed by the FCC. What does that imply.

It implies that I NEVER said I was an FCC official. The amateur auxillary
is a part an arm of the FCC Information and Compliance Bureau. That
certainly
does not make me an FCC Official. Perhaps you can compare it to this:
being
in the CAP does not make someone an AIR FORCE official.

> You average
> 2400 lies a month.

Please present your verifiable proof of each lie you claim or be found to be
making a
false accusation.

Consequences? Really? So while you and yours have been
teaching "cw",
everyone else on the planet have been rubbing their hands
together
with great anticipation. OVER HAM ALLOCATIONS! What is wrong
with you?
For the last few years all I've heard is whining over all
those new
codeless people... all WHO? The numbers are pathetic... If
we don't get
some REAL numbers soon... there won't BE any frequencies
left. Look around
you. Look at the malls, all those kids with portable
wireless "things" no
matter how bright or gheeky they are... you see anyone with
a code key? Hmm?
They play with digital equipment like we played with the old
